Hospira MedNet™ Meds™

Software User Guide

Rx Only

List No. 16037-64-04

IMPORTANT

Refer to this User Guide for complete instructions for use, warnings, and cautions associated with the Hospira MedNet™ Meds™ Software after it has been properly installed. Refer to the Installation and Configuration Guide for proper use, warnings, and cautions associated with installing and configuring the Hospira MedNet™ Meds™ Software. The help files included with the Hospira MedNet™ Meds™ Software are provided as reference only.

Intended Use

The Hospira MedNet™ Medication Management Suite (MMS) is intended to facilitate networked communication between MMS compatible computer systems and Hospira Infusion pumps. The MMS provides trained healthcare professionals with the capability to send, receive, report, and store information from interfaced external systems, and to configure and edit infusion programming parameters.

The MMS is intended to provide a way to automate the programming of infusion parameters, thereby decreasing the amount of manual steps necessary to enter infusion data. All data entry and validation of infusion parameters is performed by a trained healthcare professional according to physician’s orders.

Please read this entire guide before using the Hospira MedNet™ Meds™ Software.

For a list of Hospira MedNet™ compatible devices approved for your country and/or to obtain a copy of this guide, contact:

in the USA
The Hospira Technical Support Center
1-800-241-4002

outside the USA
The Support Center listed in your Hospira.com regional website

From our Hospira website, you can access our System Operating Manuals and this guide via the Support Center’s Infusion Pumps + Clinical Software.

Chapter 1: Introduction

Hospira MedNet™ is a server-based safety software product intended for use in healthcare facilities by trained healthcare professionals to provide valuable bedside guidance by managing IV infusion information with compatible Hospira infusion systems. The Hospira MedNet™ suite of software also includes a separate application, Hospira MedNet™ Meds™.

Hospira MedNet™ software enhances safety at the point of care with highly customizable drug libraries that guides users and help to protect patients by alerting to hard and soft, upper and lower dosing limits intended to help prevent infusion errors. These limits are based on a hospital’s specific IV administration practices.

Hospira MedNet™ software reduces manual programming steps by providing the option to allow pharmacy settings to flow directly into the compatible infusion pumps through the IV Clinical Integration (IVCI) solution. Hospira MedNet™ software connects the pharmacy validated medication order with the infusion pump and the patient’s electronic medical record (EMR), providing the opportunity for automated programming of the infusion pump.

Hospira MedNet™ software generates more than 20 different reports based on data, settings, and changes that are automatically and wirelessly collected from the compatible infusion pumps. The generated reports help to turn data into actionable data to provide visibility to clinical practice. Depending on the EMR system capability, automated documentation in the EMR is also supported by Hospira MedNet™.

Hospira MedNet™ software packages consist of the components listed below. The specific components available to you will depend on your institution’s license.

**Hospira MedNet™ Administrator™** provides the ability to manage system users, infusers, drug library downloads, infuser software updates, access points, and other configurations.

**Hospira MedNet™ Integrator™** provides interfaces to a hospital’s enterprise level applications and serves as the conduit for the exchange of data between infusers, the Hospira MedNet™ server, and a variety of hospital information systems.

**Hospira MedNet™ Meds™** provides functionality to the pharmacy for the definition and management of medications, drug libraries, clinical care areas, and infuser configurations.

**Hospira MedNet™ Performance™** delivers data from the Hospira MedNet™ server into reports designed for asset management as well as clinical assessment of Hospira MedNet™ use with selectable options to best meet the needs of the user.

**Hospira MedNet™ Programmer™** takes medication dispensing orders from the Bar Code Medication Administration (BCMA) system and translates them into operational commands which automatically populate settings on the infuser. For more information, see Hospira MedNet™ Software User Guide, Appendix B.
Terminology

This document uses the following conventions:

- References to specific values are approximations only, unless otherwise indicated.
- The terms “Hospira MedNet™ Software” and “the Software” are used interchangeably throughout this manual.

Note: Illustrations and screen representations are for illustrative purposes only and may vary from the actual software. Your computer’s display settings may affect screen representations.

General Warnings and Cautions

The following conventions are used in this user guide to denote warnings or cautions:

Caution: Contains information that could prevent product damage or hardware failure. Failure to observe a caution could result in patient or user injury.

WARNING: Warning messages contain special safety emphasis and must be observed at all times. Failure to observe a warning message is potentially life threatening.

Caution: Federal (USA) law restricts this device to sale by or on the order of a physician or other licensed practitioner.
Computer Management and Security

- Except for virus data files (typically called “dat” files), do not install upgrades, service packs, or patches to non-Hospira software on computers on which Hospira MedNet™ Software is installed, except as authorized by Hospira.
- Do not enable automatic updates to operating systems on computers on which Hospira MedNet™ Software is installed.
- Ensure that procedures are in place for backing up and restoring data, and that administrators can successfully restore data from earlier backups.
- Ensure that the network on which Hospira MedNet™ Software is used has effective security procedures in place, including physical and network access control.
- Ensure that user passwords are protected.
- Ensure a backup power supply (uninterrupted power source) is available to prevent critical data loss.

Important: We highly recommend that you regularly backup and purge your database. A database can grow to a large size that will affect the performance of your Hospira MedNet™ system.

Although we suggest to purge a database every four years at a minimum, if you have more than 2,000 infusers it would be wise to consider doing so more often. Complete backup instructions are in the Installation and Configuration Guide or you can consult our Technical Support Center.

Handling Infusers

- Refer to the System Operating Manual for the applicable infuser for warnings and cautions before handling the infusers.
- Use care when handling connectors and cables.
- Avoid twisting or bending cables and connectors.
- Ensure compliance to IEC 60601-1-1 for connecting accessories to medical devices.

Note: The infusion devices compatible with Hospira MedNet will display selectable options based on your licensing and Hospira’s compatibility matrix.

Transferring Data

- Ensure that only one instance of the Hospira MedNet™ Meds™ software is running on a computer at a time.
- To avoid inconsistencies between drug libraries, and reports, ensure that all infusers are using the same drug library version.
Notes:
Chapter 2: Logging In and Out

Logging In

To log into the Hospira MedNet Meds software:

2. Enter your user ID and password into the appropriate fields. Each field must be between 8 and 20 characters.

3. Click Log In.
Logging Out and Exiting

To log out of Hospira MedNet Meds software:

1. Click **Log Out**.

2. Click **Yes**.
3. Click **Exit**.

4. Click **Yes**.

**Note:** You will be automatically logged out of the application after 60 minutes of inactivity.
Notes:
Chapter 3: Configuration and Certificate Management

Overview

The configuration view allows you to set either English (United States) or French (Canadian). Once you make a selection, the software will display all information in that language.

Libraries associated with a language will be viewed, edited, imported or finalized in that language option.

For English (United States), the date format is displayed as mmdyyyyy, and the distal pressure unit is psi.

For French (Canadian), the date format can be displayed as follows:

- dd/mm/yy
- dd/mm/yyyy
- dd/mmm/yy
- dd/mmm/yyyy

and the distal pressure unit is mmHg.

You will need to navigate to the Configuration tab and make your selection.

Click **Save** and the appropriate language will be applied immediately.

**Note:** The language selected in Hospira MedNet Meds will automatically apply to the Hospira MedNet Software.
Certificate Management

Important: Certificates are required in order to finalize drug libraries and to download a drug library to a Plum 360. Detailed instructions regarding the installation of certificates are available from the Technical Support Center or your local Hospira representative.

Following are the Hospira MedNet supported certificate formats:

**Suitable for Import:**

<table>
<thead>
<tr>
<th>Format</th>
<th>Encoding</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>DER encoded binary</td>
<td>Base64 PEM</td>
</tr>
<tr>
<td>X.509</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>PKCS #7</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>PKCS #8</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>PKCS #12</td>
<td>Yes</td>
<td>N/A</td>
</tr>
</tbody>
</table>

PKCS #8 allows for several password based encryption algorithms. The supported algorithms are:
- no password
- PBEwithMD5andDES
- PBEwithSHA1and3KEYDESede
- PBEwithSHA1and40BITRC2

Note: You cannot import private keys using PKCS #8

**Suitable for Export:**

<table>
<thead>
<tr>
<th>Format</th>
<th>Encoding</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>DER encoded binary</td>
<td>Certificate only (no private key)</td>
</tr>
<tr>
<td>X.509</td>
<td>Yes</td>
<td>Certificate only (no private key)</td>
</tr>
<tr>
<td>PKCS #7</td>
<td>Yes</td>
<td>Certificate chain only (no private key)</td>
</tr>
<tr>
<td>PKCS #12</td>
<td>Yes</td>
<td>Certificate with private key</td>
</tr>
</tbody>
</table>
We recommend the use of PKCS#12 for easier installation.

The following three files must be installed:

- MedNet (HMSS) certificate (without private key) .cer file
- DLE (Hospira MedNet Meds) certificate (with private key) password-protected .p12 file
- Root CA certificate - cer file

**Important:** Certificates have an expiration date and will need to be renewed.
Notes:
Chapter 4: Medication List

Overview

The Medication List is the list of medications used by the hospital; it contains important data elements used in the development of drug libraries for the infusers used in your hospital.

In this chapter, you will learn how to create, import, and manage the Medication List. The chapters that follow contain detailed information on developing a drug library.

Note: When a user is in the Medication List, no other user can be in the Medication List or any library. Each library allows only one user at a time. When you are using a library, no other user can be in the Medication List.

Identifying medications in the Medication List

The Medication List requires each medication to have an External identifier (ID). The External ID is especially important if your Hospira MedNet system is integrated with another system that sends programming information to the infuser. The External ID is used to assure a match between the medication sent by the sending system and the medication rule set used by the Hospira MedNet software.

Considerations for assigning an External ID

If Hospira MedNet is to be integrated with another system (such as a BCMA system) that sends programming information to the infuser (medication, concentration, rate, etc.), each generic name in the Medication List must have a unique External ID. This External ID must be also be used by the sending system (in this case, the BCMA system). This allows, for example, all dopamine products, such as amps, vials, and syringes, to be represented as a single entry in the Medication List referring to the generic name “dopamine.” The corresponding generic level External ID number will vary depending on the BCMA system integrated to Hospira MedNet, for example, catalog code or Multum ID for Cerner Millennium, etc. Your Pharmacy Consultant will work with you to create the correct file for your implementation.

If Hospira MedNet is not to be integrated with another hospital system that sends programming information to the infuser, all that is required is that each item in the Medication List has a corresponding External ID. In this case, you may want to have various manufacturers or package sizes of the same medication represented in the Medication List. Each generic name can appear multiple times as long as each has its own unique External ID. Numeric sequences or charge master identifiers can be used for this purpose.

How External ID is used in Drug Libraries

When a drug library is developed, certain rules (listed below) that involve the External ID are enforced.

Within a drug library, for medication entries in a Clinical Care Area (CCA):

1. There can be only one rule set for each combination of External ID and Concentration.
2. There can be only one rule set for each combination of Displayed Name and Concentration.
These rules enable both the Hospira MedNet software and the infuser software to positively identify the specific medication rule set in the drug library.

**Import a Medication List**

A Medication List file may be imported into Hospira MedNet Meds multiple times. Each import file should contain all medications that can be infused even if they have been imported previously.

**Formatting the CSV file**

Importing a Medication List involves the creation of a Comma Separated Value (.csv) file containing the medication information. Your pharmacy system may support creating a file in this format or in a similar format that can be manipulated in Excel. The file can have 12 columns as specified below, if importing an entire Medication List. However, if you want to edit only the External ID and Generic Names, you can do it through the Export feature as described in *Export a Medication List*.

- The first line of the file is ignored by the Medication List Import function. It should contain the field names in the table below.
- Each subsequent line in the file should include one medication entry per line.
- Each subsequent line in the file must include data in the External ID and Generic Name fields.

**Note:** External ID and Generic Name are the only fields in which data is required.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Type</th>
<th>Number of Characters allowed¹</th>
</tr>
</thead>
<tbody>
<tr>
<td>External ID</td>
<td>String</td>
<td>20</td>
</tr>
<tr>
<td>NDC</td>
<td>String</td>
<td>20</td>
</tr>
<tr>
<td>Generic Name</td>
<td>String</td>
<td>100</td>
</tr>
<tr>
<td>Brand Name</td>
<td>String</td>
<td>100</td>
</tr>
<tr>
<td>Strength</td>
<td>Numeric</td>
<td>20</td>
</tr>
<tr>
<td>Strength Units</td>
<td>String</td>
<td>25</td>
</tr>
<tr>
<td>Volume</td>
<td>Numeric</td>
<td>20</td>
</tr>
<tr>
<td>Volume Units</td>
<td>String</td>
<td>25</td>
</tr>
<tr>
<td>Therapeutic Class ID</td>
<td>String</td>
<td>20</td>
</tr>
<tr>
<td>Therapeutic Class Description</td>
<td>String</td>
<td>200</td>
</tr>
<tr>
<td>Dosage Form ID</td>
<td>String</td>
<td>20</td>
</tr>
<tr>
<td>Dosage Form Description</td>
<td>String</td>
<td>200</td>
</tr>
</tbody>
</table>

¹ Comma (,), angle bracket (<>,), and double-quote (") characters are not permitted within fields in the import file.

The Medication List can be created as a spreadsheet and saved in .csv format to be imported. An example of a 12-column spreadsheet containing the medication list information is as follows:
### Considerations for the Medication List Import File in CSV format

Save the file to .csv format. Extracts from information systems are commonly Excel files, tab-separated files, or pipe-separated files. Each of these can be saved as a CSV file using Excel.

Remove any rows or columns in the CSV file that do not contain required data. Ensure there are 12 columns.

Evaluate the information provided to determine how the fields provided can map to the import file specifications.

- **a.** Is there an identifier for each drug that can be used for External ID?
- **b.** Does each drug have a Generic Name that contains only the generic name (without strength, volume, or dosage form)?
- **c.** Are Therapeutic Class ID and Description provided?
  - Therapeutic Class MUST have an ID. The Description is optional. (If only a Description is supplied, use the same information for ID and Description. Copy the Description column to the ID column.)
- **d.** Is there data for Dosage Form ID and Description?
  - Dosage Form MUST have an ID. The Description is optional. (If only a Description is supplied, use the same information for ID and Description. Copy the Description column to the ID column.)

Remove medications that cannot be infused on a pump from the list.

Format the columns in the file to match the import file specifications.

- **a.** Ensure that all columns are present and are named correctly (even if there is no data contained in them).
- **b.** Ensure that columns are in the proper order.
- **c.** Remove special characters (commas, left and right angle brackets, and double quote characters).

In Excel, from the Edit menu, you may use the Find/Replace option.

- Find comma character, replace with blank.
- Find left angle bracket character, replace with left parenthesis
- Find right angle bracket character, replace with right parenthesis
- Find double quote character, replace with single quote

Final check:

- **a.** Sort file by External ID.
b. A particular External ID should only appear in one row in the file.
c. Ensure that each medication has data in both the External ID and Generic Name columns.
d. A Generic Name can appear multiple times in the file with different External IDs.

Importing the Medication List

Important: Importing the Medication List replaces any medications already in the list. Complete instructions are provided in the next segment, Working with the Medication List, on page 18.

Once the file has been formatted as described above:

1. From the Medication List view, select **Import**.

The File to Import screen displays.

2. Navigate to the location of the Medication List to import.
3. Click **Select**. A pop-up window displays a preview of changes to the Medication List. Medications that are being added are displayed in green. If the Medication List currently contains medications, you will see medications that are being deleted displayed in red and medications that are being updated displayed in blue.

4. If satisfied with the preview, click **OK**.

5. To prevent the import, click **Cancel**.

6. If you selected **OK**, a message confirming the import displays.

7. Click **OK**.

**Note:** It is not possible to undo the import of the medication list once it has been completed.
Working with the Medication List

Importing a Medication List file completely replaces the existing list. Any medication entries in a Worksheet that are associated with medications that are no longer in the medication list must be deleted or reassigned to a new medication before the Worksheet can be finalized.

The following table summarizes the behavior when a new medication list is imported when there are already medications present in the list:

<table>
<thead>
<tr>
<th>Medication present in the Medication List</th>
<th>Medication present in Import File</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Y</td>
<td>N</td>
<td>Removed</td>
</tr>
<tr>
<td>Y</td>
<td>Y</td>
<td>Updated</td>
</tr>
<tr>
<td>N</td>
<td>Y</td>
<td>Added</td>
</tr>
</tbody>
</table>

For LifeCare PCA Worksheets, the user will be prompted to delete any protocols associated with medications that have been deleted when the worksheet is opened.
Medication List View

The Medication List view displays:

- Generic Name
- Brand Name
- External ID
- Strength
- Volume
- Dosage Form
- Received/Updated
- Status

You can filter the medications displayed by:

- active medications
- active and pending medications
- pending medications

with

- any generic name or External ID
- generic names beginning with (any character)
- External IDs beginning with (any character)
Add a Medication

1. Click the Medications tab.

2. Click Add.

3. Enter the medication name into the Generic Name field. This is a mandatory field.
4. Enter the Brand Name (optional field).
5. Enter the External ID. This is a mandatory field.
6. Enter the following optional information, if needed:
   - NDC (National Drug Code)
   - Strength - Amount and Unit
   - Volume - Amount and Unit
   - Therapeutic Class Code and Description (click on a row in the table to select)
   - Dosage Form Code and Description (click on a row in the table to select)

**Note:** The contents of the Therapeutic Class and Dosage Form tables are determined by the information in the Medication List import file.

Status, Source, Created On, Last Edited On, and Last Edited By, will be filled automatically after the medication has been added.

**Caution:** Generic names cannot contain the special characters greater than (>), less than (<), ampersand (&), double quotes ("), and single quotes (').

7. Click **Save**.
Edit a Medication

1. From the Medication List view, highlight the medication you want to edit.

2. Click Edit.

3. Make the changes needed.

4. Click Save.
Delete a Medication

To Delete a Medication that is not used in a Drug Library:

1. From the Medication List view, highlight the medication to be deleted.

2. Click **Delete**.
   
   The Delete Medication screen displays.

3. Click **Delete**.
The confirmation screen indicates the medication is not used in any drug library.

4. If you still wish to delete the medication, click Yes.

To Delete a Medication that is used in a Drug Library:

1. From the Medication List view, highlight the medication to be deleted.
   The Delete Medication pop-up displays.
2. Click Delete.
   The pop-up indicates the Drug Libraries that contain the medication.
3. After reading the message, if you still wish to delete the medication, click Yes.
Export a Medication List

By selecting Export, you can export a file to a location of your choice.

1. From the Medication List view, select Export.

The Select Export File Content screen displays.

2. Select All Medication Fields or Only External ID and Generic Names.

Note: Selecting to export only the external ID and Generic Names allows you to edit those two fields and then re-import them into the Medication List.

3. Click OK. The Export to File screen displays.
4. Select a location for the export of the Medication List.

5. Enter a file name.

**Note:** The medication list can only be exported in .csv (comma separated value) and XML formats. If you selected to export only the External ID and Generic Name you must export in .csv format.

6. Click Save.

**Editing an Exported External ID and Generic Name File**

1. Select the .csv file you have exported and right-click to access Notepad or similar program.
2. Right-click on the name of the file and using Notepad or similar program, edit by adding a new External ID, and new Generic Name between commas.

3. From the File menu, select Save.
   You can now import this edited file into the Medication List.
Medication List Report

1. You can select to either:
   a. Save the report in .html format to a selected location by clicking **Save to File**, or
   b. Print a report of the data currently being displayed in the Medication List view by clicking the **Print** button.

2. The appropriate window displays:

   ![Save to File Window](image)

   ![Print Window](image)

   Make your selections.

3. Click **Save** or **Print**.
Chapter 5: The Library Directory

Overview

A drug library is a collection of medication names, rule sets, Clinical Care Areas (CCAs), and infuser settings. Hospira MedNet Meds software stores drug libraries in three ways:

- Worksheets
- Active Libraries
- Archived Libraries

A Worksheet is a library that has not yet been approved (finalized) for transfer to infusers. You can store multiple Worksheets in the database; however, you may only edit one Worksheet at a time.

An Active library is a Worksheet that has been finalized. (To learn more about finalization, see Finalizing Worksheets on page 59.) Once a Worksheet has been finalized, no more changes can be made to it. Only an Active library can be transferred to infusers. Only one Active library per infuser type can exist at a time in the Hospira MedNet Meds software database.

An Archived library is a previously Active library that has been deactivated for transfer to infusers. Archived libraries can be copied but cannot be edited or downloaded to infusers.

Unless otherwise specified (for example, “Active library”), the term library used alone refers to Worksheets and to both Active and Archived libraries.

Finalizing is the process of converting a Worksheet into an Active library.

When adding a Worksheet, you need to set up CCA names, infuser settings, and medication entries in order to create a complete library.

You can create Worksheets and libraries in the following ways:

- By creating new, blank Worksheets
- By copying existing libraries, Archived libraries, or Worksheets
- By importing special files that Hospira MedNet Meds software is able to convert into a Worksheet
The Library Directory view lists the active library for each infuser type, all Worksheet libraries, and all archived libraries in the database. The following information is displayed in the Library Directory view:

<table>
<thead>
<tr>
<th>Library Directory</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>Drug Library ID</td>
</tr>
<tr>
<td>Infuser Type</td>
</tr>
<tr>
<td>Drug Library</td>
</tr>
<tr>
<td>Library Status</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Date Modified</td>
</tr>
<tr>
<td>Date Finalized</td>
</tr>
<tr>
<td>Infuser Library Version</td>
</tr>
<tr>
<td>Library Notes</td>
</tr>
</tbody>
</table>

1 The library name cannot be edited after the library is created.
2 This field is blank if the drug library is a Worksheet.
3 The finalization date is represented in Greenwich Mean Time (GMT), not local time.

**Library Directory Conventions**

The Library Directory uses the following conventions:

- You may sort all columns in the Library Directory view in either ascending or descending order by clicking on the column heading.
- You may use the vertical and horizontal scroll bar(s) to scroll to an entry.
- When you highlight an entry on the Library Directory view, buttons or features that are not available appear as “grayed” or disabled.
Step-by-Step Procedures

The following section provides step-by-step procedures that enable you to manage the Library Directory. In this section you will learn how to do the following:

- Navigate to the Library Directory list view
- Create, edit, and add a note to a Worksheet
- Delete Worksheets and archived drug libraries
- View a drug library
- Copy a drug library
- Import a drug library
- Export a drug library

To navigate to the Library Directory list view, do the following:

2. Enter your User ID and Password.

Note: In order to log in to the application and perform the procedures in this chapter, you must have the appropriate access privileges.

3. Click Log in.

The Library Directory view appears.

Note: You will not see any entries in the list until you create a Worksheet or import a library.
Chapter 5: The Library Directory

Step-by-Step Procedures

Create a Worksheet

The Create Worksheet screen appears.

2. From the Infuser Type drop-down list, select an infuser type.
3. In the Drug Library field, type a name for the library.
4. Enter a Note, if desired, for the library.

Note: Your note may contain information such as “For P & T Review” or other helpful hints to keep you organized as you build the library.

5. Click OK.

The Create Worksheet screen closes and your entry appears in the Library Directory view.
Edit a Worksheet

2. Click Edit.
3. Make desired changes.
4. Click Close.

Your modification is saved and the Library Directory view displays.

Note: Additional information on editing worksheets can be found in the infuser-specific chapters:
- Chapter 9: Plum A+, and Plum 360 Medication Entries, on page 111
- Chapter 10: LifeCare PCA Medication Entries, on page 171
- Chapter 12: SapphirePlus Medication Entries, on page 203

For LifeCare PCA only:

If you attempt to edit a drug library that contains a protocol which is referring to a medication that has been deleted from the medication list, the following pop-up screen will display.

1. Click Delete.

The protocol will be removed and you will be able to edit the Worksheet.

Note: In order to open the Worksheet, you must first delete the protocol.
Delete a Worksheet or Archived Drug Library

You may delete a Worksheet or Archived drug library from the Library Directory. When you delete a library, it is permanently removed from the system.

To delete a Worksheet or Archived drug library, do the following:

1. On the Library Directory view, highlight a Worksheet or Archived drug library.
2. Click **Delete**.

   The Delete Library screen opens.

   **Caution:** By deleting a library, you remove it from the system permanently. You may want to ensure that your system has recently been backed up before deleting a drug library.

3. Click **OK**.

   The Worksheet or library is permanently deleted and the Library Directory view appears.
**View a Drug Library**

2. Click **View**.
   
   The Drug Library Management view appears.

   **Note:** You cannot make changes when viewing a library.

3. Click **Close** to return to the Library Directory view.

   **Helpful Hint:** If you hover the mouse pointer over any medication entry in the Master Drug Formulary, a “tool tip” displays the medication’s generic name and concentration as well as the CCAs to which it has been assigned (see below). The tool tip will disappear after 5 seconds.
**Copy an Archived Library, Active Library, or Worksheet**

In order to facilitate creating or updating a drug library, you may copy Active or Archived drug libraries as well as Worksheets. When you copy a drug library, all medication rule sets, infuser settings, and CCA settings are included. The copied drug library appears as a new entry on the Library Directory view.

1. On the Library Directory view, highlight the desired drug library entry.
2. Click **Copy**.
   
   The Copy Library screen opens.

3. In the **Drug Library** field, type the name of the new drug library as you wish it to appear on the Library Directory view.

   **Note:** You may enter information into the **Notes** field, if needed.

4. Click **OK**.
   
   Your drug library is copied. The new Worksheet appears on the Library Directory view.

   **Note:** Copying is allowed only between libraries for the same infuser type.
Add or Edit Notes to a Worksheet.

2. Click Notes.

The Notes screen opens.

>Note: The **Infuser Type** and **Drug Library** fields cannot be edited.

3. Type the note or edit text in the **Notes** field.
4. Click **OK**. The note is saved and appears in the **Library Notes** field of the Library Directory.

>Note: The **Notes** field cannot be modified after a drug library is finalized.
Export an Archived Library, Active Library, or Worksheet

**Note:** Only users with the appropriate login privileges are able to export files.

You can export the rule sets from Worksheets, Archived libraries, and Active libraries as XML (Extensible Markup Language) files.

**Note:** If the exported XML file is modified, it cannot be re-imported into Hospira MedNet Meds.

You can also export a Worksheet, Archived library, or Active library as a Comma Separated (CSV) file. CSV filenames end in “.csv.” The file can be used to view rule sets in Microsoft Excel.

**Note:** Comma Separated files cannot be re-imported into Hospira MedNet Meds.

When exporting a Worksheet, Archived library, or Active library, only medication entries that have been assigned to CCAs will be exported; medication entries that are listed only in the Master Drug Formulary are not exported.

The Master Infuser and CCA Settings are included in exported XML files. When a LifeCare PCA Worksheet is exported in the CSV format, the bar code values will appear to begin with a single quote (‘) character if the file is viewed in Microsoft Excel.

**Note:** Protocols are not exported with an XML file for a LifeCare PCA Drug Library. Protocols must be manually re-entered after a PCA Drug Library is imported back into Hospira MedNet Meds.

You may export a drug library to an external location on your network or hard drive.

1. On the Library Directory view, highlight the desired drug library.
2. Click **Export**.
The Export Library screen opens.

3. Click **Browse**.

![Browse dialog box](image)

4. In the **File Name** field, type in a path and file name to use for the exported file.
5. Select either **XML Files** or **Comma Separated Files (CSV)** from the drop-down list.
6. Click **OK**.

The Export Library screen closes. The drug library is exported to the desired location.
Import a Drug Library

You may import a drug library from an XML file created by Hospira MedNet Meds. When you import a drug library, it becomes a Worksheet. The software fully validates the data ranges, precision, and relationships before adding imported data to the database.

1. From the Library Directory view, click **Import**.

The Import Library screen opens.

2. In the **Import From** screen area, select the **Infuser Type** that corresponds to the library you are importing.

3. In the **File Name:** field, type in the path and file name of the drug library you wish to import.

   **Helpful Hint:** You may search for the file name and path by clicking **Browse** and navigating to the desired file.

4. In the **Import To** screen area, select the **Infuser Type** that corresponds to the library you are importing.

5. In the **Drug Library** field, type in a name for the imported library, as you would like it to appear on the Library Directory view.

   **Note:** You may enter information into the **Notes** field, if needed.

6. Click **OK**.
The Import Library screen closes and the newly imported Worksheet appears on the Library Directory view.

**Note:** A Drug Library that contains one or more Medication Entries referring to a medication which is not in the Medication List will be imported. In order for the library to be finalized, all medication entries will need to be assigned to a medication in the Medication List.

If the file you are attempting to import contains unusable data, the software displays an error message and does not import the file.

**WARNING:** If you make changes to an exported XML file, the file cannot be imported.
Notes:
Chapter 6: Drug Library Management

Overview

The Drug Library Management view allows you to create, edit, and delete safety limits for medication entries used by the infusers. The safety limits established are then incorporated directly by the rule sets used in the drug library.

The Drug Library Management view displays when you open a Worksheet or an Active or Archived library. This view consists of two panes that display the target and source medication lists associated with individual CCAs and the Master Drug Formulary. As a CCA is created, medications that have been assigned to it will be displayed in the Target List pane at the top of the view. The complete list of medications available in the Master Drug Formulary is displayed in the Source List pane at the bottom of the view. The Master Drug Formulary is the comprehensive list of medications and rule sets defined for use in a Drug Library.

The drop-down list in each pane displays the CCAs that have been defined for the library. The active functions (buttons) available in the Drug Library Management view will vary depending on the type of library you have opened and whether or not a CCA is selected. Functions that are not available from this view will be grayed out.
Chapter 6: Drug Library Management Overview

**Note:** The Master Drug Formulary (MDF) contains a list of all medications available for use by the CCAs in the library. The MDF list functions as a "parent" to the medication entries in the Target List.

To create and complete a drug library suitable for transfer to an infuser, you will need to:

- Define the desired CCAs.
  See: **Chapter 8: Setting Up CCAs**, on page 91
- Create the medication entries.
  See: **Chapter 9: Plum A+, and Plum 360 Medication Entries**, on page 111
  See: **Chapter 10: LifeCare PCA Medication Entries**, on page 171
  See: **Chapter 12: SapphirePlus Medication Entries**, on page 203
- Arrange the medication list in the desired order.
  See: **Changing the Display Order of Medication Entries**, on page 48
- Create protocols for the LifeCare PCA infuser - Optional.
  See: **Chapter 11: Setting Up LifeCare PCA Protocols**, on page 191
- Define the Master Infuser setting.
  See: **Chapter 13: Master Infuser Setup**, on page 233
Drug Library Management Conventions

The Drug Library Management view uses the following conventions:

- The fields in the Target List and Source List panes are identical.
- The list grid includes a moveable split bar located after the fourth column. The remaining columns scroll under the first three.
- The Target List and Source List panes include a read-only field that displays the total number of medications in a selected list.
- All columns are re-sizeable and may be sorted in ascending or descending order by clicking on the column header.
- The view includes a read-only bottom status bar that displays the Library Name, Infuser, Status, Modified [date], Mode, and User.
- Commas (,), double quotes ("), and angle brackets (< >) are considered invalid characters and cannot be used in a name.

Managing Drug Libraries

The following procedures enable you to manage drug libraries for each infuser. The data that you see in the target and source panes will be different for each infuser and is consistent with the medication entry for the infuser.

Target List Procedures

- Viewing Medication Entries in a CCA
- Removing Medication Entries from a CCA
- Changing the Display Order of Medication Entries

Source List Procedures

- Viewing Medication Entries in the Master Drug Formulary
- Copying Medication Entries from One CCA to Another
- Deleting Medication Entries from the Master Drug Formulary

General Procedures

- Finalizing Worksheets
- Closing Worksheets

Caution: In the case of an auto-program, if the Hospira MedNet Software is unable to locate a matching rule set, the order will be sent to the infuser under “No Drug Selected” (infuser- and CCA-dependent) and the order data will be transmitted to the infuser. No Rule Set Limits will be available for this order. If the order is a partial auto-program, the remaining parameters will be manually programmed. See the specific infuser operating manual for additional information.
Viewing Medication Entries in a CCA

1. From the Library Directory view, highlight a Worksheet.
2. Click **Edit** or **View**.

   The Drug Library Management view opens.
3. From the Target List, select the CCA containing the medication entry you want to view.
4. Select the medication entry.
5. From the Target List, click **View**.
6. When you are finished viewing the medication entry, click **Close**.

![Image of Drug Library Management view and Target List with medication entries]
Removing Medication Entries from a CCA

Note: Only users with the appropriate login privileges are able to add and remove medication entries from CCAs.

1. From the Library Directory view, open a Worksheet for editing.
2. From the Target List, select the CCA containing the medication entry you want to remove.
3. Select the medication entry to remove.
4. From the Target List, click **Remove**.
5. At **Confirm Remove** from CCA, click **Remove**.

Note: You can delete one medication at a time from the Master Drug Formulary or you can delete several at a time by highlighting them, using the shift key or control key, and deleting them.
Changing the Display Order of Medication Entries

**Note:** Only users with the appropriate login privileges are able to change the display order of medication entries.

**Important:** The order in which the medications appear in the target list panel may not be the order in which the medications will appear on the infuser.

**To change or view the order in which medication entries are displayed:**

1. From the Target List, select a CCA.
2. Click **Arrange CCA List**.
3. Select the medication entry you want to move.

   **Helpful Hint:** You can select multiple medications to move by highlighting them.

4. Click **Move Up** or **Move Down** to position the selected medication entries.
5. Repeat for all medication entries as needed.
6. Click **Save**.

Medication entries newly added to a CCA are placed at the bottom of the assigned medications list.
### Sorting the medication entries within a CCA:

1. From the Library Directory view, open a Worksheet for editing.
2. On the Drug Library Management view, select a CCA from the Target List.
3. Click **Arrange CCA List**.

![Image of Hospira MedNet Meds™ - User Guide](image)

4. On the pop-up that appears, from the **Sort By** list, select the primary sorting criteria from the list. The selection will vary according to the infuser.

![Image of Arrange CCA List](image)

5. From the **Then By** list, select the secondary sorting criteria, if desired.
6. Click **Sort by**.
For the Plum 360, the **Sort By:** button gives you the option to sort by the Displayed Name in either ascending or descending order. Medication entries with the same Displayed Name will remain together. (See the Hospira MedNet Software Device Compatibility Matrix to determine the availability of the Plum version(s). The matrix is available through your Technical Support Center.)
Viewing Medication Entries in the Master Drug Formulary

To view a medication entry in the Master Drug Formulary:

1. Select **Master Drug Formulary** as the source location.

   ![Medication Entry in Master Drug Formulary]

   **Helpful Hint:** If you hover your mouse pointer over any medication entry in the Master Drug Formulary, a “tool tip” displays the medication’s generic name and concentration as well as the CCAs to which it has been assigned. The tool tip will disappear after 5 seconds.

2. Select the medication entry you want to view.

3. From the Source List, click **View**.

   ![Medication Entry Displayed]

   ![Medication Entry Details]

4. When you are finished viewing, click **Close**.

   **Helpful Hint:** If you are viewing an Active or Archived library, you may also double-click the medication entry to view it.
Keeping or Clearing Rule Sets for Medication Entries

1. Highlight a medication entry with existing rule sets, in either the Source List Master Drug Formulary or Target List.

2. Click Edit.

The selected medication entry displays with its rule sets.
3. Click **Select**.

At this point, you will be able to either apply the current Rule Set to another medication or select the medication highlighted and clear its current Rule Set.
4. If you click **Select Medication and CLEAR Current Rule Set**, a confirmation message displays: **Rule set will be reset to default values.**

5. Click **OK** and the medication entry selected displays but the rule set fields are now empty.

6. You can now fill in the new rule set and then click **Save and Close** when satisfied or use the **Cancel** button.

7. If you want to keep the rule set of the medication entry highlighted but want to apply that rule set to another medication:
   - Highlight the “new” medication entry

   **Helpful Hint:** To select the medication, you can use the scroll bar or type the first letter(s) of the medication or the entire name next to **Show generic names beginning with**. You can also find the medication by external ID if you use the drop-down button and select to show the medication using the **External ID**, then entering the External ID.

   - Click **Select Medication and KEEP Current Rule Set**
   A confirmation message displays: **Review rule set values before saving this rule set.**

8. Click **OK**.

9. The new entry displays. Click **Save and Close** if the entry is to your satisfaction. If not, use the **Cancel** button.
Copying Medication Entries to one or more CCAs

1. Select the target CCA to which you want to copy a medication entry.

2. Select the Master Drug Formulary or Source CCA from which you want to copy a medication entry (either the Master Drug Formulary or another CCA).

3. Select the medication entries you want to copy from the source CCA.

   **Helpful Hint:** You may select multiple entries by clicking the first medication entry you want to copy, and holding the shift key while clicking the last medication entry you want to copy. Add or remove medications from the group you have selected by using the Control key.

4. Click **Copy to Target CCA**.
5. Verify you have selected the correct medication entries.

6. Click **Copy** to copy the selected medication entries to the target CCA.

**Note:** The maximum number of medication entries in a CCA is 25 for a LifeCare PCA, and 150 for the Plum A+. For certain Plum infusers licensed for Drug Library Size Level 2, a CCA can contain up to 400 medication entries. (See the Hospira MedNet Software Device Compatibility Matrix to determine the availability of the Plum version. The matrix is available through the Technical Support Center).

**Note:** Duplicate or conflicting medication entries cannot be copied.
Deleting Medication Entries from the Master Drug Formulary

**Note:** Deleted medication entries are permanently removed from the Master Drug Formulary and from all CCAs in which they appear.

Only users with the appropriate login privileges are able to delete medication entries from the Master Drug Formulary.

1. Select **Master Drug Formulary** as the Source List.

2. From the Source List, select the medication entry you want to delete.

3. Click **Delete**.

4. From the Source List: Delete Rule Set window, click **Delete**.
5. A confirmation message displays listing all affected CCAs. Click **OK** to permanently remove the selected medication entry from the Master Drug Formulary and all CCAs in which it appears.

![Delete Medication](image)

**Note:** You cannot delete the "No Drug Selected" entry from a Plum A+ Master Drug Formulary, or any CCA.
Finalizing Worksheets

**Note:** Before finalizing a Worksheet, we recommend that a qualified person such as a hospital pharmacist or a multidisciplinary committee of clinicians review the drug library for accuracy, per hospital policy.

Only users with the appropriate login privileges are able to finalize a Worksheet.

Certificates are required in order to finalize drug libraries.

To finalize a Worksheet:

**Note:** The Generic Name and External ID of a medication entry must be present in the Master Drug Formulary for the Worksheet to be finalized.

1. From the Drug Library Management view, click **Finalize**.

2. Click **OK** to finalize the Worksheet.

3. A progress bar appears briefly.
Chapter 6: Drug Library Management

Managing Drug Libraries

**Important:** If your network connection is lost during the finalization process, copy the library that was being finalized, and then finalize the library.

**Note:** Finalization may require several minutes for large libraries. A message may display if the library does not finalize successfully within 20 minutes.

4. A pop-up confirms that the Worksheet has been finalized successfully.

![Finalize Library](image)

Library User Guide PCA Library has been finalized successfully.

5. Click **OK**.
   
   The Date Finalized displays in the Library Directory.

**Closing Worksheets**

**To close a Worksheet:**

1. From the Drug Library Management view, click **Close**.
   
   You will be returned to the Library Directory view.

**Note:** When you close a worksheet, that worksheet is saved.
Chapter 7: Hospira MedNet Meds Reports

Overview

The Hospira MedNet Meds Reports view allows you to create and print reports on drug libraries for the licensed infusers. For individual report details, refer to the report by name later in this chapter.

Note: For information about the Hospira MedNet Software reports, see Chapter 16: Reports in the Hospira MedNet Software User Guide.

Report Conventions

The following conventions are common to all reports:

• Users with the appropriate logon privileges have access to the Reports View.
• Drop-down lists display all valid selections.
• Fields appear blank when no data is available.

Report Details

Reports may span multiple pages and are navigable using the vertical and horizontal scroll bars.

All Drug Library reports display the following information:

<table>
<thead>
<tr>
<th>Licensed Infusers</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td></td>
</tr>
<tr>
<td>Drug Library</td>
<td>The name of the drug library or Worksheet</td>
</tr>
<tr>
<td>Infuser Type</td>
<td>The type of infuser</td>
</tr>
<tr>
<td>Date Finalized</td>
<td>The date or time when the Active library or Archive was finalized (not available for Worksheets)</td>
</tr>
<tr>
<td>Library State</td>
<td>The state of the library: Active, Archive, or Worksheet</td>
</tr>
</tbody>
</table>

Additional details will vary depending on the infuser you select, as described later in this chapter.

The reports will also reflect the date format and distal pressure specific to the configuration you selected.

Note: The structure of reports from Hospira MedNet Meds cannot be altered or configured by the user.
To display the Reports page:

1. Open a Worksheet or library. (For instructions on opening a Worksheet or library, see Chapter 5: The Library Directory, on page 29.)

2. Click the Reports tab.

3. Select a report from the Choose a report drop-down list.

   The report selection will vary depending on the infuser, as described further in this chapter.
Plum A+ and Plum 360 Drug Library Reports

The following reports are available:

- Drug Library
- CCA Drug Library
- Master Infuser & CCA Settings

Plum 360 Drug Library

This report displays detailed information on all medications in the Plum 360 Master Drug Formulary.

Printing Reports

To print a report:

1. Click the **Reports** tab.

   ![Image of Reports tab]

2. Select the report to print from the drop-down list.

   ![Image of Reports dropdown menu]

   The report displays.

3. Click **Print**.

   ![Image of Print button]

   The Print menu displays. Make your selection.

4. Click **Print**.

   ![Image of Print dialog box]
To Save a Report

1. Select a report that you want to save.
2. Click Save to File.

3. Navigate to a location of your choice.

4. Type in a File name.
5. Click Save and the report will be saved in .html format.
Notes:
Chapter 8: Setting Up CCAs

Overview

Before you can assign medication entries to a clinical care area (CCA), you need to add a CCA to your Worksheet. Use the CCA Setup view to add a CCA to the Worksheet. You can create a maximum of 18 CCAs for the Plum A+ infuser, and 18 CCAs for the LifeCare PCA. Hospira MedNet Meds also supports SapphirePlus, and the Plum 360 that can each accommodate up to 40 CCAs. (See the Hospira MedNet Software Device Compatibility Matrix to determine the availability of the Plum version. The matrix is available through the Technical Support Center.)

The CCA Setup view allows you to:

• Create a new CCA and assign a Service Line to it
• Make changes to an existing CCA name and Service Line
• Remove an existing CCA
• View CCA names and Service Lines
• Arrange the order in which the CCA names display on the infuser
• Set up CCA-specific infuser settings

To display the CCA Setup view, open a Worksheet for editing and click the CCA Setup tab. (For instructions on opening a Worksheet, see Chapter 5: The Library Directory, on page 29.)

Note: If you try to add a medication to a CCA that already has the maximum allowable medication entries, you will receive an error message. You will need to delete a medication from the CCA then add a new medication to the CCA in the Drug Library Management window.
Service Lines

Service Lines are used in reports to aggregate data across multiple CCAs or facilities. Each CCA is mapped to a Service Line. For example, a service line called Surgical - adult may be used to examine data from the CCAs Four West, Five North, and Five East in a single hospital.

The following Service Lines are available for use.

Note: You cannot edit or change the contents of the Service Line list.

- Ambulatory
- Anesthesia
- Behavioral health
- Bone marrow transplant
- Burn unit
- Ear, Nose & Throat
- Emergency services
- Endocrinology
- Eye
- Geriatric
- Hematology
- ICU - cardiac
- ICU - general
- ICU - medical
- ICU - neonatal
- ICU - pediatrics
- ICU - surgical
- Labor & Delivery
- Medicine - adult
- Medicine - neonatal
- Medicine - pediatric
- Multiple service line
- Obstetrics/gynecology
- Oncology - adult
- Oncology - pediatric
- Orthopedics
- Other specialty
- Outpatient Surgery
- Pain Management
- Rehabilitation
- Renal
- Short Stay
- Skilled nursing
- Special Procedures
- Surgical - adult
- Surgical - cardiovascular
- Surgical - pediatric
- Telemetry
- Transfusion Center
- Transplant
- Trauma
- Urology
Create a New CCA

1. Click the **CCA Setup** tab.
2. Click **Add**.
3. Enter the name of the new CCA.

**Note:** Displayed Names and CCA Names do not allow either commas (,) or double-quotes ("). An underscore (_) cannot be used in SapphirePlus CCA names. The number of characters allowed in a CCA name varies for each type of infuser; Plum maximum: 29; LifeCare PCA maximum: 16; and SapphirePlus maximum 15. You cannot exceed the maximum characters.

4. Select a Service Line for your CCA from the drop-down list.
5. To exclude the CCA from the reports, place a check mark in the box next to **Exclude from clinical reports**.

**Note:** Clinical reports include all reports except Asset Tracker, Asset Utilization, Event/Alarm Log, Infuser Status, and Software Download.

6. Enter a Note if desired.
7. Click **Save & Add Another** or **Save & Close**.
Edit a CCA

1. Click the **CCA Setup** tab.
2. Select the CCA you want to change.

3. Click **Edit**.
4. Edit the CCA Name, Service Line, and Notes if desired.

5. Click **Save & Edit Next** or **Save & Close**.
View a CCA

1. Click the CCA Setup tab.
2. Select the CCA you want to view.

![CCA Setup tab](image)

3. Click View.
4. When you are finished viewing, click View Next or Close.

![View CCA Name and Notes](image)
Delete a CCA

1. Click the CCA Setup tab.
2. Select the CCA you want to delete.

3. Click **Delete**.
4. A pop-up window appears to confirm the deletion.
5. Click **Delete**.

The CCA is permanently deleted from the Worksheet.

**Note:** Medication entries assigned to the deleted CCA will remain in the Master Drug Formulary and any other CCAs to which they were assigned.
Change the Display Order of CCA Names

1. Click the CCA Setup tab.

2. Click Arrange CCA Names.

3. Select the CCA names you want to move.

4. Click Move Up and Move Down to reorder the list as desired.

5. Click Save when you are satisfied with the display order.

*Helpful Hint*: You may select multiple CCAs by selecting the first CCA you want to move, and then holding the shift key while clicking the last CCA you want to move.
Setting Up a Plum 360

**Note:** Only users with the appropriate login privileges are able to edit CCA infuser settings.

Each CCA is associated with specific infuser settings. For Plum 360 infusers that can support 40 CCAs, the following settings are supported: Patient Limits consisting of minimum and maximum body surface area (BSA); minimum and maximum patient height and weight; Alarm Settings for the default occlusion pressure; and Other Infuser Parameters relating to start and standby, and dose rates.

**Note:** The CCA settings apply to all medications in the CCA.

The **Body Surface Area** setting allows you to set a minimum to maximum range for the specific CCA.

The **Minimum Patient Height** setting allows you to set the minimum patient height allowed in the CCA.

The **Maximum Patient Height** setting allows you to set the maximum patient height allowed in the CCA.

The **Minimum Patient Weight** setting allows you to set the minimum patient weight allowed in the CCA.

The **Maximum Patient Weight** setting allows you to set the maximum patient weight allowed in the CCA.

The **Default Occlusion Pressure** setting allows you to select the pressure at which the infuser will sound the distal occlusion alarm. This setting is used as the default setting for the selected CCA and can be changed when programming the infuser.

The **Distal Occlusion Pressure Auto-Reset** setting allows you to set the number of times the infuser will resume an infusion automatically if a distal occlusion is cleared within 60 seconds of detection. If you leave the Auto-Reset at zero, the default setting, occlusion alarms will not be automatically reset.

The **Delayed Start** setting allows you to select this option in the CCA and in turn allows that option for the infuser.

The **Standby** setting allows you to select this option in the CCA and in turn allows that option for the infuser.

The **Maximum Dose Rate** is the maximum delivery rate allowed in the CCA.

**Note:** The Minimum Patient Weight, Maximum Patient Weight, and Maximum Dose Rate cannot be changed by the clinician when programming the infuser.
Following are the default CCA infuser settings:

Minimum BSA 0.012 (m²)
Maximum BSA 7.07 (m²)
Minimum Patient Height 7.5 cm
Maximum Patient Height 305 cm
Minimum Patient Weight 0.1 kg
Maximum Patient Weight 500 kg
Default Occlusion Pressure 6 psi (310 mmHg)
Distal Occlusion Pressure Auto-Reset 0
Maximum Dose Rate 999 mL/hr
Delayed Start Enabled
Standby Enabled

Note: When you create a new CCA, it contains the default infuser settings until you change them.

To set up CCA settings:

1. Display the CCA Setup view by opening a Worksheet for editing and clicking the CCA Setup tab (for instructions on opening a Worksheet, see Chapter 5: The Library Directory on page 29).

2. Select a CCA from the CCA setup view.

3. Click the CCA Settings button.
4. Select the **Patient Limits** tab and edit the following information:
   - **Minimum BSA** (0.012 to 7.07)
   - **Maximum BSA** (0.012 to 7.07)
   - **Minimum Patient Height** (7.5 to 305 cm)
   - **Maximum Patient Height** (7.5 to 305 cm)
   - **Minimum Patient Weight** (0.1 to 500 kg)
   - **Maximum Patient Weight** (0.1 to 500 kg)

   ![Patient Limits Tab](image)

5. Select the **Alarm Settings** tab and edit the following information:
   - **Distal Occlusion Pressure** (1 psi to 15 psi or 52 mmHg to 776 mmHg)
   - **Distal Occlusion Auto-Reset** (0 to 10)

   ![Alarm Settings Tab](image)
6. Select the **Other Infuser Parameters** tab.

7. Select to allow the **Delayed Start** and **Standby** settings (recommended).

8. Edit the **Maximum Dose Rate**.

9. Click **Save & Continue** or **Save & Close**.
Setting Up a Plum A+ CCA

Note: Only users with the appropriate log in privileges are able to edit CCA infuser settings.

Each CCA is associated with specific infuser settings. These settings include: the default occlusion pressure, minimum and maximum patient weight, and maximum dose rate settings.

Note: The CCA settings apply to all medications in the CCA.

The Default Occlusion Pressure setting allows you to select the pressure at which the infuser will sound the distal occlusion alarm. This setting is used as the default setting for the selected CCA and can be changed when programming the infuser.

The Minimum Patient Weight setting allows you to set the minimum patient weight allowed in the CCA.

The Maximum Patient Weight setting allows you to set the maximum patient weight allowed in the CCA.

The Maximum Dose Rate is the maximum delivery rate allowed in the CCA.

Note: The Minimum Patient Weight, Maximum Patient Weight, and Maximum Dose Rate cannot be changed by the clinician when programming the infuser.

Following are the default CCA infuser settings:

Default Occlusion Pressure 6 psi (310 mmHg)
Minimum Patient Weight 0.1 kg
Maximum Patient Weight 500 kg
Maximum Dose Rate 999 mL/hr

Note: When you create a new CCA, it contains the default infuser settings until you change them.

To set up the Plum A+ CCA settings:

1. Display the CCA Setup view by opening a Worksheet for editing and clicking the CCA Setup tab (for instructions on opening a Worksheet, see Chapter 5: The Library Directory on page 29).
2. Select a CCA from the CCA setup view.

3. Click the **CCA Settings** button.

4. Edit the following information:
   - **Default Occlusion Pressure** (1 psi to 15 psi or 52 to 776 mmHg). The Default Occlusion Pressure is the threshold for the distal occlusion alarm.

   **Note:** If your institution uses Plum A+ HB Hyperbaric infusers (version 13.5), refer to the infuser's System Operating Manual for this model's expanded default occlusion pressure range. The clinician is able to set the default occlusion pressure value while programming the infuser for hyperbaric use.

   - **Minimum Patient Weight** (0.1 to 500 kg)
   - **Maximum Patient Weight** (0.1 to 500 kg)
   - **Maximum Dose Rate** (0.1 to 999 mL/hr)

5. Click **Save** to save the settings in the selected CCA.
Setting Up a LifeCare PCA CCA

Note: Only users with the appropriate login privileges are able to edit CCA infuser settings.

The only CCA-specific infuser setting for the LifeCare PCA is the Lockout Interval. The lockout interval allows you to define the minimum and maximum lockout period between PCA doses. The interval you set will apply to all medication entries in the CCA.

The default values for the LifeCare PCA are:

- Minimum Default Lockout Interval (5 minutes)
- Maximum Default Lockout Interval (120 minutes)

Note: When you create a new CCA, it contains the default infuser settings until you change them.

Note: The limits on the lockout interval cannot be changed when programming the infuser.

To set up the LifeCare PCA CCA:

1. Display the CCA Setup view by opening a Worksheet for editing and clicking the CCA Setup tab (for instructions on opening a Worksheet, see Chapter 5: The Library Directory on page 29).

2. Select a CCA from the CCA Setup view.

3. Click the CCA Settings button.

4. Edit the minimum and maximum lockout intervals (5–120 minutes) on the pop-up.

5. Click Save.
Setting Up a SapphirePlus CCA

**Note:** Only users with the appropriate login privileges are able to edit CCA infuser settings.

Each CCA is associated with specific infuser settings, including alarm capabilities for distal occlusion and air-in-line. Infuser parameters can also be set such as delivery at end of infusion.

**Note:** The CCA settings apply to all medications in the CCA.

The default CCA infuser settings are: Alarm Settings and Other Infuser Parameters. When you create a CCA, the default settings are displayed.

**Note:** Settings with the term "default" before them in the above list can be changed on the infuser by the clinician programming the device, or an authorized technician. To see all functions that can be adjusted on the infuser, refer to the SapphirePlus operating manual.

**To set up the SapphirePlus CCA:**

1. Display the CCA Setup view by opening a Worksheet for editing and clicking the CCA Setup tab (for instructions on opening a Worksheet, see Chapter 5: The Library Directory on page 29.
2. Select a CCA from the **CCA Setup** view.
3. Click the **CCA Settings** button.

CCA settings for the SapphirePlus infuser are arranged in two tabs:

- Alarm Settings
- Other Infuser Parameters
Alarm Settings

1. For **Distal Occlusion Pressure**, do the following:
   - Select the default setting units (psi or mmHg).
   - Select a default setting from the drop-down list (psi can be in 0.5 psi increments; mmHg can be in 25 mmHg increments).

2. Select a default setting for the **Alarm Volume**, either Minimum or Maximum.

3. For **Air-in-line**, select **Single Bubble Size** and **Accumulated** (Bubble Size and/or Threshold).
   - Single Bubble Size: The minimum bubble size to alarm for a single bubble
   - Accumulated Bubble Size: the size of the bubble that when detected will be added to the accumulated threshold. Only bubbles from the selected size and above will be added to the threshold
   - Accumulated Threshold: The threshold from which the pump will alarm

**Note:** Single Bubble Size and Accumulated Threshold cannot be both OFF. At least one of the selections must be ON. An accumulated air-in-line alarm can only occur if enough air is accumulated over a 15-minute period.
Examples:

With the following selected:

Single bubble = 500 mcL  
Accumulated Bubble Size = 100 mcL  
Accumulated Threshold = 500 mcL

a. A single bubble of 500 mcL is detected. An air-in-line alarm is generated.

b. A bubble of 50 mcL is detected, no alarm would be generated as it is not equal to or greater than the configured Single Bubble Size.

Additionally, nothing would be added to the Accumulated Threshold since the bubble size is less than the selected 100 mcL.

c. A bubble of 100 mcL is detected, this would not generate an alarm since the bubble size is less than 500 mcL. However, 100 mcL would be added to the Accumulated Threshold.

d. A bubble size of 400 mcL is detected. This would not trigger a Single Bubble Size alarm since it is less than the 500 mcL bubble size selected. However, since the bubble is greater than the selected Accumulated Bubble Size of 100 mcL, it would be added to the Threshold which would then total 500 mcL (the bubble size of 400 mcL + the selected 100 mcL). This would trigger an alarm since it met the Accumulated Threshold setting of 500 mcL.

For the SapphirePlus 14.x only:

You can select **Occlusion Pressure Auto-Restart** to be either the default **Enabled** or **Disabled**. If you select **Enabled**, the infusion will resume once the occlusion is cleared.

4. Click **Save & Continue** or **Save & Close**.

5. If continuing, select the **Other Infuser Parameters** tab.
Other Infuser Parameters for SapphirePlus 14.x

1. At Delivery Modes, select Continuous and/or Multistep. You must select at least one.

2. At Other Settings, select any or all of the following:
   - Delayed Start and Standby
   - Prime Reminder
   - Allow Repeat Last Infusion. To enable repeating an infusion using identical same settings.
   - Allow Pre-Program
   - Calculate Concentration
   - Enable Automatic Patient Lockout. This setting prevents patient access to settings.
   - Enable Screen Saver (Far View)

3. At Delivery at End of Infusion (General), either select None/Stop, Continue Rate, or KVO. The Default KVO Rate is between 0.1 and 20 mL/hr). The selection made will represent the default settings for that CCA when there is no drug selected. This setting does not affect rule sets.
4. At **Bolus (General)**, select the Default Level of either **Off**, **Simple** or **Advanced**. This default applies only when there is no drug selected and does not affect the rule sets. The rate can be set between 1 - 999 mL/hr with a default of 125 mL/hr.

5. At **Prime Volume**, allow the default of 20 mL or select from 2 - 25 mL.

6. At **Other**:
   a. Enter a **Maximum Volumetric Rate** can be selected from 0.1 - 999 mL/hr or leave the default at 999.
   b. From the drop-down list select the time interval to alert the user that an infusion is nearly complete. Choices are **Off**, **1 minute**, **3 minutes**, **5 minutes** and **10 minutes**.

**Note:** For a multistep infusion, the **Nearing End of Infusion Alarm** occurs x minutes before treatment ends (if x = 10 and there are 7 steps of 5 minutes each, the message will appear after 25 minutes).

For a continuous/secondary infusion, the **Nearing End of Infusion Alarm** occurs x minutes before the primary and secondary will be ended (if x = 10 and primary is 1 minute and secondary is 30 minutes the message will appear after 21 minutes).

7. At **Primary Hard Limits**, set **Maximum VTBI** from 1-9999 mL or leave the default at 9999.

8. At **Secondary Hard Limits**, set **Maximum VTBI** from 1-9999 mL or leave the default at 9999.

9. At **Multistep Hard Limits**, set **Maximum VTBI** from 1-9999 mL or leave the default at 9999. Select the **Maximum Time** from the 24-hour clock. The default is 24:00.

10. At **Brightness**, select the brightness level for the infuser from **On**, **Partial** or **Off**.

11. At **Inactivity Callback (Pump Unattended)**, set the Callback Alarm at **2 minutes**, **5 minutes** or **10 minutes**.

12. Select the default **Key Press Volume** level.

**Note:** You can **Restore Default Values** by clicking on that button.

13. Click **Save & Close**.
**Other Infuser Parameters for SapphirePlus 13.x**

1. At **Other Settings**, accept the checked default **Delayed Start** or uncheck the default.
2. For **Delivery at End of Infusion**, either select **None** or **KVO**. The Default KVO Rate is between 0.1 and 20 mL/hr).
3. For **Other**:
   a. Enter a **Maximum Volumetric Rate**.
   b. From the drop-down list select the time interval to alert the user that an infusion is nearly complete. Choices are **Off**, **1 minute**, **3 minutes**, **5 minutes** and **10 minutes**.

   **Note:** For a multistep infusion, the **Nearing End of Infusion Alarm** occurs x minutes before treatment ends (if x = 10 and there are 7 steps of 5 minutes each, the message will appear after 25 minutes).

   For a continuous/secondary infusion, the **Nearing End of Infusion Alarm** occurs x minutes before the primary and secondary will be ended (if x = 10 and primary is 1 minute and secondary is 30 minutes the message will appear after 21 minutes).

4. Select the default **Brightness** level. Choices are **On**, **Partial** and **Off**.
5. For **Inactivity Callback (Pump Unattended)**, select the notification interval for period of no activity from the drop-down list. Choices are **2 minutes**, **5 minutes** and **10 minutes**.
6. Select the default **Key Press Volume** level.

   **Note:** You can **Restore Default Values** by clicking on that button.

7. Click **Save & Close**.
Chapter 9: Plum A+, and Plum 360 Medication Entries

Overview

In this chapter, you will learn how to define clinical decision rules for medications in the Plum A+ drug library. Hospira MedNet Meds software enables you to customize dose limits for medications used in drug libraries. You can customize clinical decision rules for up to the maximum number of clinical care areas (CCAs) in the hospital, and 150 (Plum A+) or 400 medication entries (Plum 360) in each CCA, depending on your licensing.

Medication entries can be created with one of three types of rule sets, described below.

- **Full Rule Set:** Medication entries configured with a medication name, a complete or partial concentration, a specific dosing unit, and corresponding dose rate limits.
- **Limited Rule Set:** Medication entries configured with a medication name, optional diluent volume, and rate limits.
- **Label Only Rule Set:** Medication entries configured with a medication name, complete or partial concentration, and a specific dosing unit.

The display of the medication in the Drug List and the programming sequence for the clinician on the infuser will vary depending on the type of rule set defined in the drug library.

**Note:** The Clinical Use field (Plum 360 only) is an optional field and can be left blank. The default value of Clinical Use can be updated in the Master Infuser Setup.
Part 1: Plum 360

Defining Rule Sets

Full Rule Set

A Full rule set allows you to enter a complete concentration (for example, 250 mg/500 mL) or partial concentration (for example, 250 mg/_ mL, _mg/500 mL or, _mg/_mL). Creating a medication entry for the standard concentrations of any medication reduces the number of programming steps on the infuser for the clinician. At least one dosing limit value must be entered for each Full rule set.

Leaving the medication or diluent amounts blank allows the clinician to enter a non-standard concentration at the time of programming. Full rule sets defined with a partial concentration will require the clinician to enter the concentration values when the dosing units are not mL/hr. When the dosing units are mL/hr, you do not have to enter concentration information.
Limited Rule Set

A Limited rule set does not require a concentration to be defined. At least one dosing limit value must be entered for each Limited rule set. The Container Volume field is optional. When programming the infuser for a medication with a Limited rule set, the clinician enters only the rate, volume to be infused (VTBI), and duration.

Label Only Rule Set

A Label Only rule set allows the clinician to see the medication name displayed on the infuser. There are no dosing limits associated with a Label Only rule set. The clinician selects the dosing units during programming. If the dosing units are not mL/hr, the clinician also enters the concentration values.
Each type of rule set will create a different display for the medication in the Drug List on the infuser.

You can create medication entries by adding them to the Master Drug Formulary or by adding them directly to a CCA. Medication entries added to a CCA are automatically added to the Master Drug Formulary.

Within a CCA, no two medication entries may have exactly the same External ID and Concentration. Also, no two medication entries may have exactly the same Displayed Name and Concentration.

Within a CCA, a medication entry with a Displayed Name and a Concentration can have up to four Clinical Uses. Each Clinical Use can have up to four dosing units or a total of 16 possible dosing units for one medication in one CCA.

In the Master Drug Formulary, two medication entries may have the same display name, medication amount, medication unit, diluent amount, and dosing units, as long as one or more of the following limits are different:

- Lower soft limit (LSL)
- Lower hard limit (LHL)
- Upper soft limit (USL)
- Upper hard limit (UHL)

**Setting Dose Rate Limits**

Hospira MedNet Meds allows you to define dose rate limits for both primary and secondary infusions. It is important that you understand how the dose rate limits function so please read this section carefully.

You can define upper and lower soft and hard limits as part of the rule set for each medication entry that you create in the library. As you configure the limits, the software enforces the following rule:

\[
\text{Lower Hard Limit (LHL)} < \text{Lower Soft Limit (LSL)} \leq \text{Upper Soft Limit (USL)} < \text{Upper Hard Limit (UHL)}
\]

**Soft Limits**

*Soft Limits* are dose rate limits that can be overridden when programming the infuser. When a value entered on the infuser is lower than the lower soft limit or higher than the upper soft limit, the infuser displays a soft limit override confirmation message. The infuser records soft limit alerts and the user’s response to the alert in its history logs.

For example, if the upper soft limit is set to 15 mL/hr and the clinician enters 16 mL/hr, the infuser will display a soft limit override alert. This alert notifies the clinician that the entry is outside the range of the soft limits set for that medication entry. The clinician can choose to continue programming using the override, or cancel the override and edit the value. Both the override and edit events are recorded separately in the infuser’s history log.
Hard Limits

Hard limits are dose rate limits that cannot be overridden; the infuser cannot be programmed with a rate that is lower than the lower hard limit or higher than the upper hard limit.

Note: The actual patient weight is not entered until the clinician programs the infuser. Therefore, Hospira MedNet Meds software cannot verify the validity of a lower limit when entering a weight-based medication entry. The infuser performs the final check when the clinician programs the infuser.

Bolus Limits (Plum 360 with Bolus)

Bolus Limits can be defined in three ways:

- **Pump Bolus Amount** allows you to define the pump bolus amount unit, set lower and upper limits, select the maximum bolus unit, and the maximum amount of medication that can be administered in a bolus.

- **Bolus Time Limits** allow you to define the time period over which a bolus can be administered. A minimum administration time for the bolus is defined as a lower limit, while a maximum administration time is defined as an upper limit.

- **Bolus Dose Rate Limits** allow you to define the rate at which a bolus can be administered.

Note: If defining Bolus Rules using weight-based or BSA-based units:
The Bolus Dose Rate limits can be defined based on weight only if the Bolus Amount units are also based on weight.
The Bolus Dose Rate limits can be defined based on BSA only if the Bolus Amount units are also based on BSA.
Medication Entry Rules and Conventions

The Hospira MedNet Meds software uses the following conventions for Plum A+ medication entries:

- Full or Limited rule sets require at least one hard or soft limit.
- You can create medication entries by adding them to the Master Drug Formulary or by adding them directly to a CCA. Medication entries added to a CCA Target List are automatically added to the Master Drug Formulary List.
- “Validity” messages appear in red at the bottom of the Rule Set window. When you enter a value that is not allowed, the message specifies the defined range for the field, or the reason the value is not permitted.
- You cannot use the following characters in the medication name: comma (,), less than (<), greater than (>), single quotes (‘), double quotes (“), and ampersand (&).
- Once you select a medication unit, the dosing unit field will display only the enabled unit type.
- The software prohibits invalid numeric entries and signals such with an audible “beep.”
- You may use the vertical and horizontal scroll bars to navigate to an entry.
- If you do not select or populate a required field, an error message appears.
- When you highlight an entry on the Drug Library Management list view, buttons or features that are not allowed appear as “grayed” or disabled.
- When you add a new medication in the Generic Name field of the rule set window, you may search for a medication by typing the first few characters of its generic name. The drop-down list will navigate to show any matching medications.
The Plum 360 Medication Rule Set

The Rule Set window shown here is used to configure a medication entry for the Plum 360 drug library.

Plum 360 with Bolus Enabled

Note: For a list of Hospira MedNet compatible devices approved by country, refer to the Hospira MedNet Device Compatibility Matrix available through your Hospira Support Center.
## Rule Set Fields

The following table lists the fields, a brief description, and allowed value range for the infuser.

Each medication entry must have a generic name and a displayed name; you cannot save a medication entry without a name in these fields. The number of characters in the displayed name is determined by how it is displayed on the infuser’s screen. Depending on character width, the maximum number of characters allowed in a displayed name can vary from 17 to 29.

To avoid potential confusion when creating medication entries, use only the medication name in the **Displayed Name** field and ensure that the External ID is identical to the External ID used in your institution’s formulary. Do not include the diluent as part of the medication name.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Allowable Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generic Name</td>
<td>This is the medication name from your Medication List. It is selected from the drop-down list and displays the External ID (the hospital’s identifier for a medication). Strength/Volume and Dosage Form display only if part of your Medication List.</td>
<td>Not editable in the Rule Set</td>
</tr>
<tr>
<td>Displayed Name</td>
<td>This is the name that will be displayed on the infuser.</td>
<td>• Varies depending on the character width&lt;br&gt;• Cannot be blank&lt;br&gt;Caution: You cannot use the following characters in the displayed name: comma (,), less than (&lt;), greater than (&gt;), single quotes (‘), double quotes (“), and ampersand (&amp;).&lt;br&gt;Note: The display font changes on the Plum A+ infuser for lengthy displayed names.</td>
</tr>
<tr>
<td>Therapeutic Class</td>

<td>Allows you to configure whether this medication can be interrupted by a piggyback infusion.</td>
<td>Checked to enable or Unchecked (does not allow the functionality)</td>
</tr>
<tr>
<td>Dosing Unit</td>
<td>Allows you to set the standard dosing unit for the medication. This will be the default value displayed on the infuser.</td>
<td>For complete dosing units, please consult your infuser’s System Operating Manual</td>
</tr>
<tr>
<td>LHL, LSL, USL, UHL</td>
<td>Lower hard limit, lower soft limit, upper soft limit, upper hard limit. Allows you to set the upper and/or lower dose rate limits for the selected medication.</td>
<td>The units for the soft and hard limits are the same as the dosing units selected in the medication rule set</td>
</tr>
<tr>
<td>Enable Bolus (Plum 360 with Bolus)</td>
<td>Pump Bolus Amount Units, and Bolus Dose Rate Units are dependent upon the selection of the medication unit.</td>
<td>The medication unit selected will determine the allowable bolus units that can be selected from the available fields’ drop-down list.</td>
</tr>
</tbody>
</table>

Refer to your infuser’s System Operating Manual for complete details and allowable range.
Step-by-step Procedures

The following section provides step-by-step procedures that will enable you to create and manage medication entries. In this section you will learn how to do the following:

- Add a medication entry with a Full rule set in a CCA
- Add a medication entry with a Limited rule set in a CCA
- Add a medication entry with a Label Only rule set in a CCA
- Edit a medication entry in a CCA
- View a medication entry in a CCA
- Remove a medication entry from a CCA
- Add a medication entry with a Full rule set the Master Drug Formulary
- Add a medication entry with a Limited rule set to the Master Drug Formulary
- Add a Label Only medication entry to the Master Drug Formulary
- Edit a medication entry in the Master Drug Formulary
- View a medication entry in the Master Drug Formulary
- Delete a medication entry from the Master Drug Formulary
- Copy a medication entry from the Master Drug Formulary to a Target CCA
Working with CCA Medication Entries (Plum 360)

**Note:** When adding medication entries to the Target List, both the selected CCA and the Master Drug Formulary are updated. When adding to the Source List, only the Master Drug Formulary is updated.

The maximum number of medication entries allowed in a CCA is 150-400 depending on your licensing.

In the Target List, the created medication entries are grouped by Displayed Name plus Concentration. If there is no grouping of medication entries with the same Displayed Name plus Concentration, the entry will go to the bottom of the list of medication entries.

Within the grouping there is a sorting

a. Clinical Use with the Default setting of Clinical Use topping the series
b. Each group in Alphabetical order
c. Dosing units

**To add a medication entry with a Full rule set in a CCA:**

1. Select the desired CCA from the Target List drop-down list.

2. From the Target List, click **Add**.
3. Select the Generic Name of a medication.

**Note:** Selecting a generic name from the list automatically populates the **Displayed Name**, **External ID**, **Therapeutic Class**, and **Class ID** fields.

**Note:** If the desired generic name is not in the **Generic Name** list, you may add a medication to the Medication List. Alternatively, you can add the generic name by importing a new **Medication List** via the **Medication Import** function of the Hospira MedNet software.

**Note:** The **Displayed Name** can be changed as desired; for example, to accommodate Tall Man lettering or another unique name. The maximum number of characters in a Displayed Name is determined by how it is displayed on the infuser screen. Depending on character width, the maximum number of characters allowed in a medication name can vary from 17 to 29.
4. Select **Full** (if not selected) from the **Rule Sets** drop-down list.

5. Enter a Medication Amount. Select a Medication Unit from the drop-down list and enter a Diluent Amount, if desired.

6. Place a check mark in the box next to Piggyback delivery allowed, if desired.

7. Place a check mark in the box next to Allow piggyback to interrupt this infusion, if desired.

8. Enter a Clinical Use, if desired.

9. Click **Next**.
10. Select the dosing unit from the drop-down list and enter the values for soft and hard limits. (You must specify at least one limit.)

11. Once you enter a value for Dosing Unit and dosing limit(s), you will be able to add three more dosing units, for a total of four dosing units for the selected medication entry with the same Displayed Name and Concentration.

You can add each selection by clicking the green plus “+” sign.

![Diagram of medication entry](image)

**Note:** A tab with red text denotes either incomplete or invalid dosing unit and/or dosing limits.

12. Click **Save & Add Another Rule Set**, or **Save & Close** to add the medication entry to the CCA.

or

If you have a Bolus enabled infuser, you can place a tick mark next to **Enable Bolus** if you want to set bolus dose limits for this medication (Optional).

*Note: For a list of Hospira MedNet compatible devices approved by country, refer to the Hospira MedNet Device Compatibility Matrix available through your Hospira Support Center.*
For the Plum 360 with Bolus only:

To Set a Bolus:

a. Select the **Pump Bolus Amount Unit** from the drop-down list. (The allowable units are determined by the selection of Medication Unit.) Enter the desired values for Lower Hard Limit, Lower Soft Limit, Upper Hard Limit, and Upper Soft Limit.

Enter **Maximum Bolus Amount** and **Unit** if desired. These fields are enabled when the Bolus Amount Limits Unit is weight-based or BSA-based.

b. Enter the desired values for **Bolus Time Limits**: Lower Hard Limit, Lower Soft Limit, Upper Hard Limit, and Upper Soft Limit.

c. Select the Bolus Dose Rate Limits from the drop-down list and enter the desired values for Lower Hard Limit, Lower Soft Limit, Upper Hard Limit, and Upper Soft Limit.

d. Click **Save & Close**.
To add a medication entry with a Limited rule set in a CCA:

1. Select the desired CCA from the Target List drop-down list.
2. From the Target List, click Add.

3. Select the Generic Name of a medication.

Note: Selecting a generic name from the list automatically populates the Displayed Name, External ID, Therapeutic Class, and Class ID fields.

Note: If the desired generic name is not in the Generic Name list, you may add a medication to the Medication List. Alternatively, you can add the generic name by importing a new Medication List via the Medication Import function of the Hospira MedNet software.

4. The Displayed Name can be changed as desired, for example, to accommodate Tall Man lettering or another unique name. The maximum number of characters in a Displayed Name is determined by how it is displayed on the infuser screen. Depending on character width, the maximum number of characters allowed in a medication name can vary from 17 to 29.

5. Select Limited (if not selected) from the Rule Sets drop-down list.
6. Enter Container Volume, if desired.
7. Place a check mark in the box next to Piggyback delivery allowed, if desired.
8. Place a check mark in the box next to Allow piggyback to interrupt this infusion, if desired.
9. Enter a Clinical Use, if desired.

10. Click Next.
11. Select the dosing unit from the drop-down list and enter the values for soft and hard limits. (You must specify at least one limit.)

12. Once you enter a value for Dosing Unit and dosing limit(s), you will be able to add three more dosing units, for a total of four dosing units for the selected medication entry with the same Displayed Name and Concentration. You can add each selection by clicking the green plus “+” sign.

Note: A tab with red text denotes either incomplete or invalid dosing unit and/or dosing limits.

13. Click Save & Add Another Rule Set or Save & Close to add the medication entry to the CCA.

or

If you have a Bolus enabled infuser, you can place a tick mark next to Enable Bolus if you want to set bolus dose limits for this medication. See To Set a Bolus: on page 125.
To add a Label Only rule set medication entry in a CCA:

1. Select the desired CCA from the Target List drop-down list.

2. From the Target List, click **Add**.

3. Select the Generic Name of a medication.

   **Note:** Selecting a **Generic Name** from the list automatically populates the **Displayed Name**, **External ID**, **Therapeutic Class**, and **Class ID** fields.

   If the desired generic name is not in the **Generic Name** list, you may add a medication to the Medication List. Alternatively, you can add the generic name by importing a new **Medication List** via the **Medication Import** function of the Hospira MedNet software.
4. The **Displayed Name** can be changed as desired, for example, to accommodate Tall Man lettering or another unique name. The maximum number of characters in a Displayed Name is determined by how it is displayed on the infuser screen. Depending on character width, the maximum number of characters allowed in a medication name can vary from 17 to 29.

5. Select **Label Only** from the **Rule Sets** drop-down list.

6. Place a check mark in the box next to **Piggyback delivery allowed**, if desired.

7. Place a check mark in the box next to **Allow Piggyback to interrupt this infusion**, if desired.

8. Click **Next**.

9. Click **Save & Add Another** or **Save & Close** to add the medication entry to the CCA.

or

If you have a Bolus enabled infuser, you can place a tick mark next to Enable Bolus if you want to set bolus dose limits for this medication. See **To Set a Bolus** on page 125.
To edit a medication entry in a CCA:

1. Select the CCA containing the medication entry you want to view from the Target List drop-down list.

2. From the Target List, select the medication entry you want to edit.
3. Click **Edit**.

   **Helpful Hint:** You can also double-click a medication entry to display the **Rule Set** dialog box.

4. Make changes as desired.

   **Note:** You cannot change the **Therapeutic Class** or **Class ID** when editing a medication entry in a CCA.

5. Click **Save & Close** to save changes.
Note: If the medication entry that is edited is assigned to only one CCA, the medication entry will also be updated with the same change in the Master Drug Formulary. If the medication entry that is edited is assigned to more than one CCA, a new medication entry will be created in the Master Drug Formulary.

To view a medication entry in a CCA:

1. Select the CCA containing the medication entry you want to view from the Target List drop-down list.

2. From the Target List, select the medication entry you want to view.
3. Click View.

4. Click Close to exit the screen.
To remove a medication entry from a CCA:

1. Select the CCA containing the medication entry you want to remove from the Target List drop-down list.

2. Select the medication entry you want to remove.
3. Click **Remove**.

4. At the confirmation to remove from the CCA, click **Remove**.
Working with the Master Drug Formulary (Plum 360)

The Master Drug Formulary can contain medication entries not assigned to a CCA, to facilitate later use. The total number of medication entries in the Master Drug Formulary for the Plum 360 infuser can either be 7,200 or 16,000, depending on your license.

To add a medication entry with a Full rule set to the Master Drug Formulary:

1. Select Master Drug Formulary as the Source List.

2. From the Source List, click Add.

3. Select the Generic Name for the medication entry.

   Note: Selecting a Generic Name from the drop-down list automatically populates the Displayed Name, External ID, Therapeutic Class, and Class ID fields.

4. Click Select Medication.
Note: The **Displayed Name** field cannot be left blank. The maximum number of characters in a medication name is determined by how it is displayed on the infuser screen after it is downloaded. Depending on character width, the maximum number of characters allowed in a medication name can vary from 17 to 29.

Note: If the desired generic name is not in the **Generic Name** drop-down list, you may add a medication to the Medication List. Alternatively, you can add the generic name by importing a new **Medication List** via the **Medication Import** function of the Hospira MedNet software.

5. Select **Full** (if not already selected) from the **Rule Sets** drop-down list.

6. Enter a **Medication Amount** (optional), select the **Medication Unit** and **Diluent Amount** (optional).

7. Select the dosing unit and type the values for soft and hard limits. (You must specify at least one limit.)

8. Click **Save & Add Another Dosing Unit** or **Save & Close** to add the medication entry to the Master Drug Formulary.

Note: When a medication entry is added to the Master Drug Formulary, it is not assigned to a CCA.
To add a Limited rule set medication entry to the Master Drug Formulary:

1. Select **Master Drug Formulary** as the Source List.
2. From the Source List, click **Add**.
3. Select the Generic Name for the medication entry.
   
   **Note:** Selecting a **Generic Name** from the drop-down list automatically populates the **Displayed Name**, **External ID**, **Therapeutic Class**, and **Class ID** fields.

4. Click **Select Medication**.
   
   **Note:** The **Displayed Name** field cannot be left blank. The maximum number of characters in a displayed name is determined by how it is displayed on the infuser screen after it is downloaded. Depending on character width, the maximum number of characters allowed in a medication name can vary from 17 to 29.
Note: If the desired generic name is not in the **Generic Name** drop-down list, you may add a medication to the Medication List. Alternatively, you can add the generic name by importing a new **Medication List** via the **Medication Import** function of the Hospira MedNet software.

5. Select **Limited** from the **Rule Sets** drop-down list.

6. Type the **Container Volume** amount (optional).

7. Select mL/hr and enter the values for soft and hard limits. (You must specify at least one limit.)

8. Click **Save & Add Another Dosing Unit** or **Save and Close**.

9. If you have a Bolus enabled infuser, you can place a tick mark next to Enable Bolus if you want to set bolus dose limits for this medication. See **To Set a Bolus** on page 125.

Note: When a medication entry is added to the Master Drug Formulary, it is not assigned to a CCA.
To add a Label Only medication entry to the Master Drug Formulary:

1. Select **Master Drug Formulary** as the Source List.

2. From the Source List, click **Add**.

3. Select the Generic Name for the medication entry.

**Note:** Selecting a **Generic Name** from the drop-down list automatically populates the **Displayed Name**, **External ID**, **Therapeutic Class**, and **Class ID** fields.
Note: The Displayed Name field cannot be left blank. The maximum number of characters in a displayed name is determined by how it is displayed on the infuser screen after it is downloaded. Depending on character width, the maximum number of characters allowed in a medication name can vary from 17 to 29.

Note: If the desired generic name is not in the Generic Name drop-down list (or if no generic names appear in the list), you may add a medication to the Medication List. Alternatively, you can add the generic name by importing a new Medication List via the Medication Import function of the Hospira MedNet software.

4. Select Label Only from the Rule Sets drop-down list.
5. Place a check mark in the box next to Piggyback delivery allowed, if desired.
6. Click Save & Add Another Rule Set or Save & Close to add the medication entry to the Master Drug Formulary.

If you have a Bolus enabled infuser, you can place a tick mark next to Enable Bolus if you want to set bolus dose limits for this medication. See To Set a Bolus: on page 125.

Note: When a medication entry is added to the Master Drug Formulary, it is not assigned to any CCA.
To edit a medication entry in the Master Drug Formulary:

1. Select **Master Drug Formulary** as the Source List.

![Image of Master Drug Formulary](image.png)

2. From the Source List, select the medication entry you want to edit.

3. Click **Edit**.

**Helpful Hint:** You can also double-click a medication entry to display the **Rule Set** dialog box.

4. Make changes as desired.

![Image of Rule Set](image.png)

5. Click **Save & Close** to save changes.

**Important:** Changing the dosing unit or medication unit will erase all previously entered limits.

**Note:** When a medication entry is edited, the changes are reflected in the Master Drug Formulary and a confirmation pop-up displays the CCAs that are affected.
To view a medication entry in the Master Drug Formulary:

1. Select Master Drug Formulary from the Source List.

2. From the Source List, select the medication entry you want to view.

3. Click View.

4. Click Close to exit the screen.
To delete a medication in the Master Drug Formulary:

1. Select **Master Drug Formulary** from the Source List.

2. From the Source List, select the medication entry you want to delete.

3. Click **Delete**.
The following pop-up will display only if the medication entry is assigned to one or more CCA.

4. Click **OK**.
To copy to Target CCA:

1. Select a medication entry from the Master Drug Formulary.

**Note:** A Target List CCA must be selected before you can copy a medication entry to a Target CCA from the Master Drug Formulary.

2. Click **Copy to Target CCA**.

3. Click **Copy** on the **Confirm Copy to CCA** pop-up.
Part 2: Plum A+

Defining Rule Sets

Full Rule Set

A Full rule set allows you to enter a complete concentration (for example, 250 mg/500 mL) or partial concentration (for example, 250 mg/ _ mL, _ mg/500 mL or, _ mg/ _ mL). Creating a medication entry for the standard concentrations of any medication reduces the number of programming steps on the infuser for the clinician. At least one dosing limit value must be entered for each Full rule set.

Leaving the medication or diluent amounts blank allows the clinician to enter a non-standard concentration at the time of programming. Full rule sets defined with a partial concentration will require the clinician to enter the concentration values when the dosing units are not mL/hr. When the dosing units are mL/hr, you do not have to enter concentration information.
Limited Rule Set

A Limited rule set does not require a concentration to be defined. At least one dosing limit value must be entered for each Limited rule set. The Container Volume field is optional. When programming the infuser for a medication with a Limited rule set, the clinician enters only the rate, volume to be infused (VTBI) and duration.

Label Only Rule Set

A Label Only rule set allows the clinician to see the medication name displayed on the infuser. There are no dosing limits associated with a Label Only rule set. The clinician selects the dosing units during programming. If the dosing units are not mL/hr, the clinician also enters the concentration values.
Each type of rule set will create a different display for the medication in the Drug List on the infuser.

You can create medication entries by adding them to the Master Drug Formulary or by adding them directly to a CCA. Medication entries added to a CCA are automatically added to the Master Drug Formulary.

Within a CCA, no two medication entries may have exactly the same External ID and Concentration. Also, no two medication entries may have exactly the same Displayed Name and Concentration.

In the Master Drug Formulary, two medication entries may have the same display name, medication amount, medication unit, diluent amount, and dosing units, as long as one or more of the following limits are different:

- Lower soft limit (LSL)
- Lower hard limit (LHL)
- Upper soft limit (USL)
- Upper hard limit (UHL)

**Setting Dose Rate Limits**

Hospira MedNet Meds allows you to define dose rate limits for both primary and secondary infusions. It is important that you understand how the dose rate limits function so please read this section carefully.

You can define upper and lower soft and hard limits as part of the rule set for each medication entry that you create in the library. As you configure the limits, the software enforces the following rule:

\[
\text{Lower Hard Limit (LHL)} < \text{Lower Soft Limit (LSL)} \leq \text{Upper Soft Limit (USL)} < \text{Upper Hard Limit (UHL)}
\]

**Soft Limits**

*Soft Limits* are dose rate limits that can be overridden when programming the infuser. When a value entered on the infuser is lower than the lower soft limit or higher than the upper soft limit, the infuser displays a soft limit override confirmation message. The infuser records soft limit alerts and the user’s response to the alert in its history logs.

For example, if the upper soft limit is set to 15 mL/hr and the clinician enters 16 mL/hr, the infuser will display a soft limit override alert. This alert notifies the clinician that the entry is outside the range of the soft limits set for that medication entry. The clinician can choose to continue programming using the override, or cancel the override and edit the value. Both the override and edit events are recorded separately in the infuser’s history log.

**Hard Limits**

*Hard limits* are dose rate limits that cannot be overridden; the infuser cannot be programmed with a rate that is lower than the lower hard limit or higher than the upper hard limit. (These events are not recorded in the infuser’s history log file for Plum infusers with software versions prior to version 13.4.)
Note: The actual patient weight is not entered until the clinician programs the infuser. Therefore, Hospira MedNet Meds software cannot verify the validity of a lower limit when entering a weight-based medication entry. The infuser performs the final check when the clinician programs the infuser.

Medication Entry Rules and Conventions

The Hospira MedNet Meds software uses the following conventions for Plum A+ medication entries:

- Full or Limited rule sets require at least one hard or soft limit.
- You can create medication entries by adding them to the Master Drug Formulary or by adding them directly to a CCA. Medication entries added to a CCA Target List are automatically added to the Master Drug Formulary List.
- “Validity” messages appear in red at the bottom of the Rule Set window. When you enter a value that is not allowed, the message specifies the defined range for the field, or the reason the value is not permitted.
- You cannot use the following characters in the medication name: comma (,), less than (<), greater than (>), single quotes (‘), double quotes (“), and ampersand (&).
- Once you select a medication unit, the dosing unit field will display only the enabled unit type.
- The software prohibits invalid numeric entries and signals such with an audible “beep.”
- You may use the vertical and horizontal scroll bars to navigate to an entry.
- If you do not select or populate a required field, an error message appears.
- When you highlight an entry on the Drug Library Management list view, buttons or features that are not allowed appear as “grayed” or disabled.
- When you add a new medication in the Generic Name field of the rule set window, you may search for a medication by typing the first few characters of its generic name. The drop-down list will navigate to show any matching medications.
The Plum A+ Medication Rule Set

The Rule Set window shown here is used to configure a medication entry for the Plum A+ drug library.
Rule Set Fields

The following table lists the fields, a brief description and allowed value range for the infuser.

Each medication entry must have a generic name and a displayed name; you cannot save a medication entry without a name in these fields. The number of characters in the displayed name is determined by how it is displayed on the infuser’s screen. Depending on character width, the maximum number of characters allowed in a displayed name can vary from 17 to 29.

To avoid potential confusion when creating medication entries, use only the medication name in the **Displayed Name** field and ensure that the external ID is identical to the external ID used in your institution’s formulary. Do not include the diluent as part of the medication name.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Allowable Range</th>

</table>
Step-by-step Procedures

The following section provides step-by-step procedures that will enable you to create and manage medication entries. In this section you will learn how to do the following:

- Add a medication entry with a Full rule set in a CCA
- Add a medication entry with a Limited rule set in a CCA
- Add a medication entry with a Label Only rule set in a CCA
- Edit a medication entry in a CCA
- View a medication entry in a CCA
- Remove a medication entry from a CCA
- Add a medication entry with a Full rule set the Master Drug Formulary
- Add a medication entry with a Limited rule set to the Master Drug Formulary
- Add a Label Only medication entry to the Master Drug Formulary
- Edit a medication entry in the Master Drug Formulary
- View a medication entry in the Master Drug Formulary
- Delete a medication entry from the Master Drug Formulary
- Copy a medication entry from the Master Drug Formulary to a Target CCA

### Diluent Amount

- Allows you to set the diluent amount associated with the medication entry. The diluent amount will vary depending on the container size, overfill, and volume of added solution.
- **Allowable Range:** 0.1–9999 and “Blank”

### Dosing Unit

- Allows you to set the standard dosing unit for the medication. This will be the default value displayed on the infuser. Once dosing unit and concentration are set in Hospira MedNet Meds, they cannot be changed on the infuser by the clinician programming the device.
- **Allowable Range:** mL/hr, mcg/kg/min, mcg/kg/hr, mcg/min, mcg/hr, mg/kg/hr, mg/min, mg/hr, grams/hr, ng/kg/min, mmol/min, mmol/hr, mEq/hr, Million units/hr, units/kg/min, units/kg/hr, units/min, units/hr, or mUn/min

### LHL, LSL, USL, UHL

- Lower hard limit, lower soft limit, upper soft limit, upper hard limit.
- Allows you to set the upper and/or lower dose rate limits for the selected medication.
- **Allowable Range:**
  - For ng/kg/min, mcg/kg/min, mcg/kg/hr, mcg/min, mcg/hr, mg/kg/hr, mg/min, mg/hr, mg/kg/hr, grams/hr, Million Units/hr, mEq/hr, mmol/min, mmol/hr:
    - 0.001–999*
  - For mL/hr, mUn/min, units/min, units/hr, units/kg/hr, units/kg/min:
    - 0.1–999

* Some infusers support a range of 100-9999. Refer to your infuser’s System Operating Manual for complete details and allowable range.

---

**Table:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Allowable Range</th>

</thead>
<tbody>
<tr>
<td>Diluent Amount</td>
<td>Allows you to set the diluent amount associated with the medication entry.</td>
<td>0.1–9999 and “Blank”</td>
</tr>
<tr>
<td>Dosing Unit</td>
<td>Allows you to set the standard dosing unit for the medication.</td>
<td>mL/hr, mcg/kg/min, mcg/kg/hr, mcg/min, mcg/hr, mg/kg/hr, mg/min, mg/hr, grams/hr, ng/kg/min, mmol/min, mmol/hr, mEq/hr, Million units/hr, units/kg/min, units/kg/hr, units/min, units/hr, or mUn/min</td>
</tr>
<tr>
<td>LHL, LSL, USL, UHL</td>
<td>Lower hard limit, lower soft limit, upper soft limit, upper hard limit.</td>
<td>The units for the soft and hard limits are the same as the dosing units selected in the medication rule set.</td>
</tr>
</tbody>
</table>

### Note:
- For a list of Hospira MedNet compatible devices approved by country, refer to the Hospira MedNet Device Compatibility Matrix available through your Hospira Support Center.
Chapter 9: Plum A+, and Plum 360 Medication Entries

Working with CCA Medication Entries (Plum A+)

Note: When adding medication entries to the Target List, both the selected CCA and the Master Drug Formulary are updated. When adding to the Source List, only the Master Drug Formulary is updated.

The maximum number of medication entries allowed in a CCA is 150.

To add a medication entry with a Full rule set in a CCA:

1. Select the desired CCA as the Target List from the drop-down list.

2. From the Target List, click Add.
3. Select the **Generic Name** for the medication entry.

**Note:** Selecting a generic name from the drop-down list automatically populates the **Displayed Name**, **External ID**, **Therapeutic Class**, and **Class ID** fields.

**Note:** The **Displayed Name** can be altered as desired, for example, to accommodate “Tall Man lettering.” The maximum number of characters in a **Displayed Name** is determined by how it is displayed on the infuser screen. Depending on character width, the maximum number of characters allowed in a medication name can vary from 17 to 29.

**Note:** If the desired generic name is not in the **Generic Name** drop-down list (or if no generic names appear in the list), you may add a medication to the Medication List. Alternatively, you can add the generic name by importing a new **Medication List** via the **Medication Import** function of the Hospira MedNet software.

4. The **Displayed Name** can now be changed as desired; for example, to accommodate Tall Man lettering or another unique name.

5. Select **Full** (if not selected) from the **Rule Sets** drop-down list.

6. Select the medication unit and enter a Medication Amount and Diluent Amount (if desired).

7. Select the dosing unit and enter the values for soft and hard limits. (You must specify at least one limit.)

8. Click **Save & Add Another** or **Save & Close** to add the medication entry to the CCA.
To add a medication entry with a Limited rule set in a CCA:

1. Select the desired CCA as the Target List.

2. From the Target List, click Add.

3. Select the Generic Name for the medication entry.

**Note:** Selecting a **Generic Name** from the drop-down list automatically populates the **Displayed Name**, **External ID**, **Therapeutic Class**, and **Class ID** fields.

**Note:** The **Displayed Name** can be altered as desired, for example, to accommodate Tall Man lettering. The maximum number of characters in a **Displayed Name** is determined by how it is displayed on the infuser screen. Depending on character width, the maximum number of characters allowed in a medication name can vary from 17 to 29.

**Note:** If the desired generic name is not in the **Generic Name** drop-down list (or if no generic names appear in the list), you may add a medication to the Medication List. Alternatively, you can add the generic name by importing a new **Medication List** via the **Medication Import** function of the Hospira MedNet software.
4. The **Displayed Name** can now be changed as desired; for example, to accommodate Tall Man lettering or another unique name.

5. Select **Limited** from the **Rule Sets** drop-down list.

6. Enter the container volume amount (optional).

7. Select mL/hr and enter the values for soft and hard limits. (You must specify at least one limit.)

8. Click **Save & Add Another** or **Save & Close** to add the medication entry to the CCA.
To add a Label Only rule set medication entry in a CCA:

1. Select the desired CCA as the Target List.

2. From the Target List, click Add.

3. Select the generic name for the medication entry from the drop-down list.

**Note:** Selecting a **Generic Name** from the drop-down list automatically populates the **Displayed Name**, **External ID**, **Therapeutic Class**, and **Class ID** fields.

**Note:** The **Displayed Name** can be altered as desired, for example, to accommodate Tall Man lettering. The maximum number of characters in a **Displayed Name** is determined by how it is displayed on the infuser screen. Depending on character width, the maximum number of characters allowed in a medication name can vary from 17 to 29.

**Note:** If the desired generic name is not in the **Generic Name** drop-down list (or if no generic names appear in the list), you may add a medication to the Medication List. Alternatively, you can add the generic name by importing a new **Medication List** via the **Medication Import** function of the Hospira MedNet software.
4. The **Displayed Name** can now be changed as desired, for example, to accommodate Tall Man lettering or another unique name.

5. Select **Label Only** from the **Rule Sets** drop-down list.

6. Click **Save & Add Another** or **Save & Close** to add the medication entry to the CCA.
To edit a medication entry in a CCA:

1. Select the CCA containing the medication entry you want to edit from the drop-down list.

2. From the Target List, select the medication entry you want to edit.

3. Click **Edit**.

   **Helpful Hint:** You can also double-click a medication entry to display the **Rule Set** dialog box.

4. Make changes as desired.

   **Note:** You cannot change the Therapeutic Class or Class ID when editing a medication entry in a CCA.

5. Click **Save & Close** to save changes.

   **Note:** If the medication that is edited is assigned to only one CCA, the medication will also be edited in the Master Drug Formulary. If the medication that is edited is assigned to more than one CCA, a new medication will be created in the Master Drug Formulary.
To view a medication entry in a CCA:

1. Select the CCA containing the medication entry you want to view from the Target List drop-down.

2. From the Target List, select the medication entry you want to view.

3. Click View.

To remove a medication entry from a CCA:

1. Select the CCA containing the medication entry you want to remove from the Target List drop-down.

2. Select the medication entry you want to remove.

3. Click Remove.
4. At the confirmation to remove from the CCA, click **Remove**.
Working with the Master Drug Formulary (Plum A+)

The Master Drug Formulary can contain medication entries not assigned to a CCA, to facilitate later use. The total number of medication entries in the Master Drug Formulary for the Plum A+ infuser cannot exceed 3,510.

To add a medication entry with a Full rule set to the Master Drug Formulary:

1. Select **Master Drug Formulary** as the Source List.

2. From the Source List, click **Add**.

3. Select the Generic Name for the medication entry from the drop-down list.

**Note:** Selecting a **Generic Name** from the drop-down list automatically populates the **Displayed Name**, **External ID**, **Therapeutic Class**, and **Class ID** fields.

**Note:** The **Displayed Name** field cannot be left blank. The maximum number of characters in a medication name is determined by how it is displayed on the infuser screen after it is downloaded. Depending on character width, the maximum number of characters allowed in a medication name can vary from 17 to 29.

**Note:** If the desired generic name is not in the **Generic Name** drop-down list, you may add a medication to the Medication List. Alternatively, you can add the generic name by importing a new **Medication List** via the **Medication Import** function of the Hospira MedNet software.
4. Select **Full** (if not already selected) from the **Rule Sets** drop-down list.

5. Select the **Medication Unit** and enter a **Medication Amount** (optional) and **Diluent Amount** (optional).

6. Select the dosing unit and type the values for soft and hard limits. (You must specify at least one limit.)

7. Click **Save & Add Another** or **Save & Close** to add the medication entry to the Master Drug Formulary.

**Note:** When a medication entry is added to the Master Drug Formulary, it is not assigned to a CCA.
To add a Limited rule set medication entry to the Master Drug Formulary:

1. Select **Master Drug Formulary** as the Source List.

2. From the Source List, click **Add**.

3. Select the Generic Name for the medication entry from the drop-down list.

**Note:** Selecting a **Generic Name** from the drop-down list automatically populates the **Displayed Name**, **External ID**, **Therapeutic Class**, and **Class ID** fields.

**Note:** The **Displayed Name** field cannot be left blank. The maximum number of characters in a displayed name is determined by how it is displayed on the infuser screen after it is downloaded. Depending on character width, the maximum number of characters allowed in a medication name can vary from 17 to 29.

**Note:** If the desired generic name is not in the **Generic Name** drop-down list (or if no generic names appear in the list), you may add a medication to the Medication List. Alternatively, you can add the generic name by importing a new **Medication List** via the **Medication Import** function of the Hospira MedNet software.

---

**To add a Limited rule set medication entry to the Master Drug Formulary:**

1. Select **Master Drug Formulary** as the Source List.

   ![Source List: Master Drug Formulary](image)

2. From the Source List, click **Add**.

3. Select the Generic Name for the medication entry from the drop-down list.

   **Note:** Selecting a **Generic Name** from the drop-down list automatically populates the **Displayed Name**, **External ID**, **Therapeutic Class**, and **Class ID** fields.

   **Note:** The **Displayed Name** field cannot be left blank. The maximum number of characters in a displayed name is determined by how it is displayed on the infuser screen after it is downloaded. Depending on character width, the maximum number of characters allowed in a medication name can vary from 17 to 29.

   **Note:** If the desired generic name is not in the **Generic Name** drop-down list (or if no generic names appear in the list), you may add a medication to the Medication List. Alternatively, you can add the generic name by importing a new **Medication List** via the **Medication Import** function of the Hospira MedNet software.
Chapter 9: Plum A+, and Plum 360 Medication Entries

Working with the Master Drug Formulary (Plum A+)

4. Select **Limited** from the **Rule Sets** drop-down list.
5. Type the **Container Volume** amount (optional).
6. Select **mL/hr** and enter the values for soft and hard limits. (You must specify at least one limit.)

7. Click **Save & Add Another** or **Save & Close** to add the medication entry to the Master Drug Formulary.

**Note:** When a medication entry is added to the Master Drug Formulary, it is not assigned to a CCA.

**To add a Label Only medication entry to the Master Drug Formulary:**

1. Select **Master Drug Formulary** as the Source List.

2. From the Source List, click **Add**.
3. Select the **Generic Name** for the medication entry from the drop-down list.

**Note:** Selecting a **Generic Name** from the drop-down list automatically populates the **Display Name**, **External ID**, **Therapeutic Class**, and **Class ID** fields.
Note: The **Displayed Name** field cannot be left blank. The maximum number of characters in a displayed name is determined by how it is displayed on the infuser screen after it is downloaded. Depending on character width, the maximum number of characters allowed in a medication name can vary from 17 to 29.

Note: If the desired generic name is not in the **Generic Name** drop-down list (or if no generic names appear in the list), you may add a medication to the Medication List. Alternatively, you can add the generic name by importing a new Medication List via the Medication Import function of the Hospira MedNet software.

4. Select **Label Only** from the **Rule Sets** drop-down list.
5. Click **Save & Add Another** or **Save & Close** to add the medication entry to the Master Drug Formulary.

Note: When a medication entry is added to the Master Drug Formulary, it is not assigned to any CCA.
To edit a medication entry in the Master Drug Formulary:

1. Select Master Drug Formulary as the Source List.

2. From the Source List, select the medication entry you want to edit.

3. Click Edit.

   **Helpful Hint:** You can also double-click a medication entry to display the Rule Set dialog box.

4. Make changes as desired.

5. Click Save & Close to save changes.

**Important:** Changing the dosing unit or medication unit will erase all previously entered limits.

**Note:** When a medication entry is edited, the changes are reflected in the Master Drug Formulary and in all CCAs in which the medication is listed.
To view a medication entry in the Master Drug Formulary:

1. Select **Master Drug Formulary** from the Source List.

2. From the Source List, select the medication entry you want to view.
3. Click **View**.
4. Click **Close** to exit the screen.
To delete a medication in the Master Drug Formulary:

1. Select **Master Drug Formulary** from the Source List.

![Source List: Master Drug Formulary]

2. From the Source List, select the medication entry you want to delete.

![Source List: Delete Rule Set]

3. Click **Delete**.
The following pop-up will display only if the medication entry is assigned to one or more CCA.

4. Click **OK**.
To copy to Target CCA:

1. Select a medication entry from the Master Drug Formulary.

   **Note:** A Target List CCA must be selected before you can copy a medication entry to a Target CCA from the Master Drug Formulary.

2. Click **Copy to Target CCA**.

3. Click **Copy** on the **Confirm Copy to CCA** pop-up.
Chapter 10: LifeCare PCA Medication Entries

Overview

In this chapter you will learn to define clinical decision rules for medications in the LifeCare PCA drug library.

Hospira MedNet Meds software enables you to customize dose rate limits for medications used in drug libraries. You can customize clinical decision rules for up to 18 different clinical care areas (CCAs) in the hospital and up to 25 medication entries in each CCA.

Defining Rule Sets

Medication entries in the LifeCare PCA drug library can be created with specific dose rate limits. Selected fields are required and all other fields are optional.

The required fields for a LifeCare PCA medication entry are:

- Generic name
- Displayed name
- Medication amount and unit
- Diluent amount
- One bar code identifier

You can create medication entries by adding them to the Master Drug Formulary or by adding them directly to a CCA. Medication entries added to a CCA are automatically added to the Master Drug Formulary.

Within a CCA, no two medication entries may have exactly the same External ID and Concentration. Also, no two medication entries may have exactly the same Displayed Name and Concentration.

In the Master Drug Formulary, two medication entries may have the same displayed name, medication amount, medication unit, diluent amount, and dosing units as long as one or more of the limits for loading dose, PCA dose, continuous rate, and dose limit are different:

- Lower soft limit (LSL)
- Lower hard limit (LHL)
- Upper soft limit (USL)
- Upper hard limit (UHL)
Setting Dose Limits

Hospira MedNet Meds allows you to define dose rate limits for the loading dose, PCA dose, continuous rate, and dose limit. It is important that you understand how the limits function so please read this section carefully.

You can define upper and lower soft and hard limits as part of the rule set for each medication entry you create in the library. As you configure the limits, the software enforces the following rules:

\[
\text{Lower Hard Limit (LHL)} < \text{Lower Soft Limit (LSL)} \leq \text{Upper Soft Limit (USL)} < \text{Upper Hard Limit (UHL)}
\]

*Soft limits* are dose rate limits that can be overridden when programming the infuser. When a value entered on the infuser is lower than the lower soft limit or higher than the upper soft limit, the infuser displays a soft limit override confirmation message. The infuser records soft limit alerts and the users’ responses to the alerts to its history logs.

For example, if the upper soft limit is set to 1.8 mg and the clinician enters 2 mg, the infuser will display a soft limit override alert. This alert notifies the clinician that the entry is outside the range of the soft limits set for that medication in the drug library. The clinician can choose to continue programming using the override, or cancel the override and edit the value. The alert and the clinician’s response are recorded in the infuser’s history log.

*Hard limits* are dose rate limits that cannot be overridden; the infuser cannot be programmed with a rate that is lower than a lower hard limit or higher than an upper hard limit. Hard limit alerts are recorded in the infuser’s history log.

If a Lower Hard Limit (LHL) or an Upper Hard Limit (UHL) are not specified in the rule set, the prescription drug limits will function as the LHL or UHL.
Medication Entry Rules and Conventions

The Hospira MedNet Meds software uses the following conventions for the LifeCare PCA medication entries:

• Entry of upper hard and soft limits and lower hard and soft limits is optional, not required.
• You can create medication entries by adding them to the Master Drug Formulary or by adding them directly to a CCA. Medication entries added to a CCA Target List are automatically added to the Master Drug Formulary List.
• “Validity” messages appear in red at the bottom of the Rule Set window. When you enter a value that is not allowed, the message specifies the defined range for the field, or the reason the value is not permitted.
• Displayed Name cannot contain comma (,) or double-quote (”) characters. Most other special characters, as well as all alphabetic and numeric characters, are acceptable.
• Once you select a medication unit, the dosing unit field will display only the enabled unit type.
• The software prohibits invalid numeric entries and signals such with an audible “beep.”
• You may use the vertical and horizontal scroll bars to navigate to an entry.
• If you do not select or populate a required field, an error message appears.
• When you highlight an entry on the Drug Library Management list view, buttons or features that are not allowed appear as “grayed” or disabled.
• When you add a new medication in the Generic Name field of the rule set window, you may search for a medication by typing the first few characters of its generic name. The drop-down list will navigate to show any matching medications.
The LifeCare PCA Medication Rule Set

The Rule Set window, seen below, enables you to configure a medication entry for the LifeCare PCA drug library.

![The LifeCare PCA Medication Rule Set window](image)
### Rule Set Fields

The following table lists the fields, a brief description, and allowed value range for the infuser.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Allowable Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generic Name</td>
<td>The medication name from your Medication List. It is selected from the drop-down list and displays the External ID (the hospital's identifier for a medication). Strength/Volume and Dosage Form display if defined in the Medication List.</td>
<td>Not editable in the Rule Set</td>
</tr>
<tr>
<td>Displayed Name</td>
<td>The name that will be displayed on the infuser.</td>
<td>• Varies depending on the character width&lt;br&gt;• Cannot be blank&lt;br&gt;Displayed Name cannot contain comma (,) or double-quote (&quot;) characters. All alphabetic and numeric characters are acceptable.</td>
</tr>
<tr>
<td>Therapeutic Class</td>
<td>The therapeutic class assigned to the medication entry.</td>
<td>Not editable in the Rule Set</td>
</tr>
<tr>
<td>Class ID</td>
<td>The ID of the therapeutic class assigned to the medication entry.</td>
<td>Not editable in the Rule Set</td>
</tr>
<tr>
<td>Medication Amount</td>
<td>Allows you to enter the medication amount in the units selected.</td>
<td>• For mg: 0.1–999.9&lt;br&gt;• For mcg: 1–15,000</td>
</tr>
<tr>
<td>Medication Unit</td>
<td>Allows you to select the unit of measure for your medication amount.</td>
<td>mcg or mg</td>
</tr>
<tr>
<td>Diluent Amount</td>
<td>Allows you to set the total volume of the PCA vial.</td>
<td>1–30 mL</td>
</tr>
<tr>
<td>Displayed Concentration</td>
<td>The concentration of medication per mL.</td>
<td>Calculated by the software as Medication Amount divided by Diluent Amount</td>
</tr>
<tr>
<td>Bar Codes</td>
<td>Allows you to enter up to five (5) different bar codes for each medication entry.</td>
<td>• Numeric or alphanumeric&lt;br&gt;• Each bar code must be unique.&lt;br&gt;• At least one bar code is required.&lt;br&gt;• The printed bar code length must be less than 4.2 cm (about 16-17 characters in a typical font).&lt;br&gt;• Enter the bar code value without any space or punctuation characters such as parentheses.</td>
</tr>
<tr>
<td>Dosing Unit</td>
<td>The dosing unit for the medication.</td>
<td>The dosing unit field automatically populates once the medication unit is selected</td>
</tr>
<tr>
<td>Dose Limit</td>
<td>Allows you to specify the amount of medication that can be administered via PCA dose and continuous delivery in a rolling time period.</td>
<td>• Choices include one (1), four (4), six (6), or twelve (12) hours.&lt;br&gt;• Default time interval = four (4) hours (required).</td>
</tr>
</tbody>
</table>
Chapter 10: LifeCare PCA Medication Entries

The LifeCare PCA Medication Rule Set

Note: For a list of Hospira MedNet compatible devices approved by country, refer to the Hospira MedNet Device Compatibility Matrix available through your Hospira Support Center.

LifeCare PCA Prescription Delivery Limits

The LifeCare PCA infuser enforces Prescription Delivery limits for Loading Dose, PCA Dose, Continuous Rate, and Dose Limit. The exact limits enforced depend on the concentration of the medication. See the LifeCare PCA System Operating Manual for additional information.

**Note:** Drug and concentration selections are rounded up to the nearest tenth of a digit for mg/mL values or to the nearest digit for mcg/mL values. Minimum delivery rate is 0.1 mL/hr for concentrations between 0.1 and 1.0 mg/mL.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Allowable Range</th>

The Rule Set window displays the Prescription Delivery Limits next to each rule set type (Loading Dose, PCA Dose, Continuous Rate, and Dose Limit) once a medication has been selected and its concentration has been defined.

These limits are enforced by the infuser as hard limits, regardless of whether hard limits have been explicitly defined in Hospira MedNet Meds. Hospira MedNet Meds prevents the user from entering a hard limit value which will violate these limits.

**Note:** Hospira MedNet Reports will contain data for hard limits alerts encountered by the user regardless of whether the limit is one that is explicitly defined in Hospira MedNet Meds or one that is enforced by the infuser.
Navigate to the LifeCare PCA Rule Set Window

The procedures in this chapter begin at the Rule Set window. To navigate to the Rule Set window, follow the path listed below:

*Library Directory -> Drug Library Worksheet - LifeCare Infuser Type -> Drug Library Management view*

Step-by-step Procedures

The following section provides step-by-step procedures that will enable you to create and manage medication entries. In this section you will learn to do the following:

- Add a medication entry in a CCA
- Edit a medication entry in a CCA
- View a medication entry in a CCA
- Remove a medication entry from a CCA
- Add a medication entry in the Master Drug Formulary
- Edit a medication entry in the Master Drug Formulary
- View a medication entry in the Master Drug Formulary
- Delete a medication entry from the Master Drug Formulary
- Copy a medication entry from the Master Drug Formulary to a Target CCA

To display the **Rule Set** window, open a Worksheet and click **Add** or **Edit**. (For instructions on opening a Worksheet, see Chapter 5: The Library Directory, on page 29.)

To add a medication entry in a CCA:

1. Select the desired CCA as the Target List.
2. From the Target List, click **Add**.
3. Highlight a medication from the **Select a Medication** screen.

![Select a Medication window](image)

**Note:** Selecting a **Generic Name** from the medication list automatically populates the **Displayed Name**, **External ID**, the **Therapeutic Class**, and the **Class ID** fields.

4. Click **Select Medication** to access the Rule Set.

![Rule Set window](image)

**Note:** The **Displayed Name** can be edited once populated. The maximum number of characters in the **Displayed Name** is determined by how it is displayed on the infuser screen. Depending on character width, the maximum number of characters allowed in the displayed name can vary from 10 to 16.
5. You can edit the Medication Amount, the Medication Unit, and the Diluent Amount. The Displayed Concentration is calculated based on the data entered into these fields.

**Note:** The dosing units for Loading Dose, PCA Dose, Continuous Rate, and Dose Limit automatically populate after the medication unit is selected.

6. Enter the bar codes for the medication. At least one bar code is required to save the medication entry.

**Note:** You can use a PC-based bar code scanner (one that attaches to the PC via a "keyboard wedge") in order to populate the bar code value. To do this, select a bar code field and scan the bar code on the medication vial. The scanner will read the medication bar code and populate the bar code field with the scanned value.

7. Enter soft and hard limits for Loading Dose (optional).
8. Enter soft and hard limits for PCA Dose (optional).

**Note:** The minimum and maximum values for the lockout intervals automatically populate based on the range defined for the CCA.

9. Enter soft and hard limits for Continuous Rate (optional).
10. Enter the time interval and upper soft or hard limits for Dose Limit (optional).

**Note:** When a soft or hard Dose Limit is entered, the clinician MUST always enter a Dose Limit on the infuser during programming.

11. Click **Save & Add Another** or **Save & Close** to add the medication entry to the CCA.

**To edit a medication entry in a CCA:**

1. Select the CCA containing the medication entry you want to edit from the **Target List** drop-down.
2. From the Target List, select the medication entry you want to edit.
3. Click **Edit**.

**Helpful Hint:** You can also double-click a medication entry to display the **Rule Set** dialog box.
Note: A Medication Rule Set can be edited once a medication is assigned to a protocol without having to delete the protocol. However, if the rule set is being used by one or more protocols; medication, concentration, and time interval information cannot be edited.

4. Make changes as needed.

Note: You cannot change the Therapeutic class or the Class ID when editing a medication entry in a CCA.

5. Click **Save & Close** to save your changes.

Note: If the medication is assigned to another CCA, a new medication is created in the Master Drug Formulary. If the medication is not assigned to another CCA, the changes are applied to both the medication in the CCA and the medication in the Master Drug Formulary.
To view a medication entry in a CCA:

1. Select the CCA containing the medication entry you want to view from the **Target List** drop-down.

2. Select a medication.
3. Click **View**.
4. Click **Close** to exit the screen.
To remove a medication entry from a CCA:

1. Select the CCA containing the medication entry you want to remove from the **Target List** drop-down.

2. Select a medication.

3. Click **Remove**.

4. Click **Remove** on the **Confirm Remove from CCA** pop-up.

**Note:** The medication entry is not removed from the Master Drug Formulary.
Working with the Master Drug Formulary

The Master Drug Formulary can contain medication entries not assigned to a CCA, to facilitate later use. The maximum number of medication entries in the Master Drug Formulary is 585, of which 100 unique medication entries can be assigned to CCAs. For example, \textit{Morphine 1 mg/mL} would be considered as one unique medication entry whether it is assigned to one or more CCAs.

\textbf{Note:} Refer to \textit{Rule Set Fields} on page 175 for information on allowable ranges.

To add a medication entry in the Master Drug Formulary:

1. Select \textit{Master Drug Formulary} as the Source List.
2. From the Source List, click \textbf{Add}.
3. Highlight a medication from the \textbf{Select a Medication} screen.

\textbf{Note:} Selecting a \textit{Generic Name} from the medication list automatically populates the \textit{Displayed Name}, \textit{External ID}, the \textit{Therapeutic Class}, and the \textit{Class ID} fields.

4. Click \textbf{Select Medication} to access the Rule Set.

\textbf{Note:} Selecting a \textit{Generic Name} from the medication list automatically populates the \textit{Displayed Name}, \textit{External ID}, the \textit{Therapeutic Class}, and the \textit{Class ID} fields.
Chapter 10: LifeCare PCA Medication Entries

Working with the Master Drug Formulary

Note: For a list of Hospira MedNet compatible devices approved by country, refer to the Hospira MedNet Device Compatibility Matrix available through your Hospira Support Center.

Note: The **Displayed Name** can be edited once populated. The maximum number of characters in a **Displayed Name** is determined by how it is displayed on the infuser screen. Depending on character width, the maximum number of characters allowed in a medication entry can vary from 10 to 16.

5. Enter the Medication Amount, select the Medication Unit, and enter the Diluent Amount. The displayed concentration is calculated based on the data entered into these fields.

**Note:** The dosing units for Loading Dose, PCA Dose, Continuous Rate, and Dose Limit automatically populate after the medication unit is selected.

6. Enter the bar codes for the medication. At least one bar code is required to save the medication entry.
7. Enter soft and hard limits for Loading Dose (optional).
8. Enter soft and hard limits for PCA Dose (optional).

**Note:** The minimum and maximum values for the lockout intervals automatically populate based on the range defined for the CCA.

9. Enter soft and hard limits for Continuous Rate (optional).
10. Enter the time interval and soft and hard limits for Dose Limit.
Note: The clinician is prompted on the infuser to enter a **Dose Limit** for the time interval selected.

11. Click **Save & Add Another** or **Save & Close** to add the medication entry to the CCA.

Note: When a medication entry is added to the Master Drug Formulary, it is not assigned to a CCA.

To edit a medication entry in the Master Drug Formulary:

1. Select **Master Drug Formulary** from the Source List.
2. From the Source List, select the medication entry you want to edit.
3. Click **Edit**.

*Helpful Hint:* You can also double-click a medication entry to display the **Rule Set** dialog box.
4. Make any desired changes.

**Note:** You cannot change the Therapeutic class or the Class ID when editing a medication entry in the Master Drug Formulary.

5. Click **Save & Close** to save your changes.

**Note:** When a medication entry is edited, the changes are reflected in the Master Drug Formulary and in all CCAs in which the medication is listed.

To view a medication entry in the Master Drug Formulary:

1. Select **Master Drug Formulary** from the Source List.
2. From the Source List, select the medication entry you want to view.
3. Click **View**.

4. Click **Close** to exit the screen.

To delete a medication entry from the Master Drug Formulary:

1. Select **Master Drug Formulary** from the Source List.

2. From the Source List, select the medication entry you want to delete.
3. Click **Delete**.

4. Click **OK** on the **Delete Medication** pop-up.

**Note:** If the selected medication is not attached to a CCA, the medication entry will be removed from the Master Drug Formulary and no pop-up will display.
To copy to Target CCA:

1. Select a medication entry from the Master Drug Formulary.

   **Note:** A Target List CCA must be selected before you can copy a medication entry to a Target CCA from the Master Drug Formulary.

2. Click **Copy to Target CCA**.

3. Click **Copy** on the **Confirm Copy to CCA** pop-up.
Chapter 11: Setting Up LifeCare PCA Protocols

Overview

Note: Only users with the appropriate login privileges are able to setup LifeCare PCA Protocols.

Protocols are frequently used therapy settings stored in the infuser’s memory. Protocols can be recalled easily, making it unnecessary for the clinician to program the same therapy setting each time it is needed. You can define up to five protocols for each Clinical Care Area (CCA). The same protocol may be used across CCAs.

Note: First, create a medication entry in the CCA before you define a protocol for that medication.

To add a protocol for a medication entry:

1. Display the Protocols view by opening a Worksheet for editing and clicking the Protocols tab (for instructions on opening a Worksheet, see Chapter 5: The Library Directory on page 29).

2. Under Target List, select a CCA from the drop-down list.

3. Click Add.
4. Select a medication entry.

5. Click **OK**.

6. Enter a **Protocol Number** or accept the default number.

**Note:** The protocol number must be unique and cannot be re-used within a drug library. The protocol name, however, can be a duplicate within a drug library.

7. Enter a **Protocol Name**.

**Note:** The Protocol Name is not displayed on the LifeCare PCA infuser.
8. Select a **Delivery Mode** from the following choices:
   a. PCA
   b. PCA + Continuous
   c. Continuous
9. Based on the delivery mode you have chosen, enter variables for the enabled fields. All enabled fields are required.
10. Click **Save**.

**Note:** All protocol dosing must be equal to or within the soft limits of the rule set for that medication and concentration (as shown in the *Medication Entry Limits* table). Values must be in the range allowed by the infuser, or an error message appears.

**To edit a protocol:**

1. From a Target List CCA, select the protocol to edit.
2. Click **Edit**.
3. Enter the desired changes.
4. Click **Save**.

**Note:** All protocol dosing must be equal to or within the soft limits of the rule set for that medication and concentration (as shown in the **Medication Entry Limits** table). Values must be in the range allowed by the infuser, or an error message appears.
To view a protocol:

1. From a Target List CCA, select the protocol to view.
2. Click View.

   ![View Protocol](image)

   The selected protocol displays.
3. Click Close to exit the screen.

To remove a protocol from a CCA:

1. From a Target List CCA, select the protocol to be removed.
2. Click Remove from CCA.

![Remove from CCA](image)
3. Click **Remove** on the **Confirm Remove Protocols from CCA** pop-up.

![Confirm Remove Protocols from CCA](image)

To add a protocol to the Master Protocol List:

1. Display the Protocols view by opening a Worksheet for editing and clicking the **Protocols** tab (for instructions on opening a Worksheet, see **Chapter 5: The Library Directory on page 29**).

   ![Protocols View](image)

2. Under **Source List**, select the **Master Protocol List** from the drop-down list.
3. Click **Add**.
4. Select a medication entry.

5. **Click OK.**

6. Enter a **Protocol Number** or accept the default number.

**Note:** The protocol number must be unique and cannot be re-used within a drug library. The protocol name, however, can be a duplicate within a drug library.

7. Enter a **Protocol Name**.

**Note:** The Protocol Name is not displayed on the LifeCare PCA infuser.

---

Note: For a list of Hospira MedNet compatible devices approved by country, refer to the Hospira MedNet Device Compatibility Matrix available through your Hospira Support Center.
8. Select a **Delivery Mode** from the following choices:
   a. PCA
   b. PCA + Continuous
   c. Continuous

9. Based on the delivery mode you have chosen, enter variables for the enabled fields. All enabled fields are required.

10. Click **Save**.

**Note:** All protocol dosing must be equal to or within the soft limits of the rule set for that medication and concentration (as shown in the [Medication Entry Limits](#) table). Values must be in the range allowed by the infuser, or an error message appears.

**To edit a protocol in the Master Protocol List:**

1. Select a protocol from the **Source List: Master Protocol List**.

2. Click **Edit**.
3. Enter the desired changes.

4. Click **Save**.

**To view a protocol in the Master Protocol List:**

1. Select the protocol to view.
2. Click **View**.
The selected protocol displays.

3. Click **Close** to exit the screen.

**To delete a protocol from the Master Protocol List:**

1. Select the protocol to delete.
2. Click **Delete from Master Protocol List.**
3. Click **Remove** on the **Confirm Remove Protocols from CCA** pop-up.

4. Click **OK**.

**Note:** If the selected protocol is not associated with a CCA there will be no confirmation message. The protocol is removed from the Master Protocol list.

**To copy a protocol to a CCA:**

**Note:** Once a protocol has been entered and saved, the protocol is available for duplication to other CCAs using the **Copy from Master Protocol List** button.

1. Select a CCA from the **Target List** drop-down list.
2. Select a protocol to be copied from the **Source List** to the selected CCA.

**Note:** A protocol can only be copied to a CCA if a medication entry with the same Generic Name, External ID, Container Concentration, and Time Interval exists in the CCA you are copying to.

3. Click **Copy to Target CCA**.
4. Click **Copy** in the **Confirm Copy Protocol to CCA** pop-up.
Chapter 12: SapphirePlus Medication Entries

Overview

This chapter explains how to create and define clinical decision rules for medications in the SapphirePlus drug library.

The Hospira MedNet Meds software enables you to customize dose-rate limits for medications used in drug libraries. You can customize clinical decision rules for up to 40 different clinical care areas (CCAs) in the hospital and up to 400 medication entries in each CCA. The Master Drug Formulary can contain a maximum of 14,495 medication entries but can only assign up to 11,150 medication entries to the combined CCAs.

Defining Rule Sets

To create a rule set for a medication, specify the name of the medication, the concentration, dose rate limits, and bolus limits consistent with your IV infusion therapy best practices. Each medication entry must have a generic name and a displayed name. Beyond that, you can create medication entries specific to your institution.

Important: The medication entry parameters are linked together and the programming sequence displayed on the infuser is dependent on how the rule set is defined. Please read this section carefully.

The possible combinations for medication concentration include:

- Complete concentration defined (for example, 400 mg/250 mL)
- Partial concentration defined (for example, 400 mg/__ mL, __mg/__ mL, __mg/250 mL)
- No Concentration
- Diluent Only

Once the medication unit has been selected, the units displayed in the drop-down list for dose rate limits, bolus amount limits, and bolus dose rate limits will include only the selections that are appropriate for that medication unit. For example, when the medication unit is grams, mg, or mcg, all the dosing units will be in the gram “family.”

Another characteristic of IV medication administration relates to administering a bolus dose. The Hospira MedNet Meds software accommodates defining limits for bolus administration by allowing three types of bolus rules to be configured independently:

- Bolus amount limits
- Bolus time limits
- Bolus dose rate limits

Bolus limits must be defined in the same unit “family” as the medication unit.

Within a CCA, no two medication entries may have exactly the same External ID and Concentration. Also, no two medication entries may have exactly the same Displayed Name and Concentration. These represent the two unique combinations.
In the Master Drug Formulary, two medication entries may have the same displayed name, medication amount, medication unit, diluent amount, and dosing units, as long as one or more attributes of the dose rate limits or bolus dose rate limits are different.

**Complete Concentration**

To create a medication entry with a specific concentration defined, enter the medication amount, medication unit, and diluent amount.

The clinician will not be able to change the concentration on the infuser for this medication.

![Source List: Edit Rule Set](image)

**Note:** Please consult the Q Core SapphirePlus User Manual for the infuser’s detailed information and functionality.
Partial Concentration

To create a medication entry with a partial concentration defined, you must select the desired medication unit. The other concentration fields are optional. Leaving the medication amount or the diluent amount blank allows the clinician to enter a non-standard concentration at the time of programming.

Note: Please consult the Q Core SapphirePlus User Manual for the infuser’s detailed information and functionality.
No concentration

To create a medication entry with no concentration defined, check “No Concentration.” The corresponding concentration fields will be grayed out. This type of rule set is useful when you simply want the name of the medication to display on the infuser and concentration or diluent volume is not appropriate for that medication.

Note: Please consult the Q Core SapphirePlus User Manual for the infuser’s detailed information and functionality.
**Diluent Only**

To create a Diluent Only medication entry, check “Diluent Only.” You may enter a specific diluent volume or leave the field blank. The clinician will be prompted to enter the diluent volume when programming the infuser if you leave the field blank. This type of rule set is useful for solutions like Dextrose 5% in Water, TPN, and others where the medication amount is not pertinent.

**Note:** Please consult the Q Core SapphirePlus User Manual for the infuser’s detailed information and functionality.
Setting Limits

Hospira MedNet Meds allows you to define dose rate limits, and bolus limits for medications infused through the SapphirePlus infuser.

You can define upper and lower soft and hard limits as part of the rule set for each medication entry created in the library. As you configure the limits, the software enforces the following rules:

\[
\text{Lower Hard Limit (LHL)} \leq \text{Lower Soft Limit (LSL)} \leq \text{Upper Soft Limit (USL)} \leq \text{Upper Hard Limit (UHL)}
\]

**Soft Limits** are dose rate limits that can be overridden when programming the infuser. When a value entered on the infuser is lower than the lower soft limit or higher than the upper soft limit, the infuser displays a soft limit override confirmation message. The infuser records soft limit overrides.

For example, if the upper soft limit is set to 10 mcg/kg/min and the clinician enters 15 mcg/kg/min, the infuser will display a soft limit override alert. This alert notifies the clinician that the entry is outside the range of the soft limits set for that medication in the drug library. The clinician can choose to continue programming using the override or cancel the override and edit the value.

**Hard Limits** are dose rate limits that cannot be overridden.

**Bolus Limits** can be defined in three ways:

- **Bolus Amount Limits** allow you to define the total amount of medication that can be administered in a bolus.
- **Bolus Time Limits** allow you to define the time period over which a bolus can be administered. A minimum administration time for the bolus is defined as a lower limit, while a maximum administration time is defined as an upper limit.
- **Bolus Dose Rate Limits** allow you to define the rate at which a bolus can be administered.

**Note:** If defining Bolus Rules by weight:
The Bolus Dose Rate limits can be defined based on weight only if the Bolus Amount units are also based on weight.
SapphirePlus Therapy Modes

Programming workflow on the SapphirePlus infuser requires the user to select a CCA. The user can then proceed to select the medication, enter the infusion settings (rate, volume, time, patient weight, as appropriate), confirm and start the infusion.

The SapphirePlus drug library contains settings that control which therapy modes are available on the infuser for each medication entry. In the medication rule set view, checkboxes are used to enable each of the following therapy modes:

- **Basic (Continuous):** Allows the user to program the medication as a primary infusion.
- **Bolus:** Allows the user to program a bolus delivery from either a primary or secondary infusion.
- **Piggyback (Secondary):** Allows the user to program an infusion from a secondary container once a primary infusion has been programmed.

**Note:** The maximum rate for a piggyback infusion from a secondary container is 500 mL/hr.

- **Multistep:** Allows the user to program an infusion with up to 25 sequential steps.
Medication Entry Rules and Conventions

The Hospira MedNet Meds software uses the following conventions for SapphirePlus medication entries:

- Entry of upper hard and soft limits, and lower hard and soft limits, is optional, not required.
- Medication entries can be created by adding them to either the Master Drug Formulary or directly to a CCA. Medication entries added to a CCA Target List are automatically copied into the Master Drug Formulary List.
- “Validity” messages appear in red at the bottom of the Rule Set window. When you enter a value that is not allowed, the message specifies the defined range for the field, or the reason the value is not permitted.
- Displayed Name cannot contain comma (,) double-quote (“”) lesser than (<) or greater than (>) characters. All alphabetic and numeric characters are acceptable as are the following: . % / # * - _ & ( ) + SPACE

For SapphirePlus 14.x, the Displayed Name may appear on the infuser in two consecutive lines. Therefore, Hospira MedNet Meds reflects the infuser by showing two Displayed Name fields allowing for 40 characters that can be entered two ways, as shown below for Amino Acid 2% Dextrose 10%:

In the first Displayed Name you could have **Amino Acid 2%** -

and then you would type

**Dextrose 10%** in the Displayed Name (Optional) field

or split it as follows:

**Amino** in the first Displayed Name field

**2% - Dextrose 10%** in the Displayed Name (Optional) field

The **Displayed Name** field must contain an entry of at least one character. The **Displayed Name (optional)** field can remain empty.

**Note:** SapphirePlus 13.x only has one Displayed Name field.

- Once you select a medication unit, the dosing unit field will display only the enabled unit type.
- The software prohibits invalid numeric entries and signals them with an audible “beep.”
- You may use the vertical and horizontal scroll bars to navigate to an entry.
- If you do not select or populate a required field, an error message appears.
- When you highlight an entry on the Drug Library Management list view, buttons or features that are not allowed appear as “grayed” or disabled.
- When you add a new medication in the Generic Name field of the Rule Set window, you may search for a medication by typing the first few characters of its generic name. The drop-down list will navigate to show any matching medications.
The SapphirePlus Medication Rule Set

When you configure a medication for use in the SapphirePlus drug library, the Rule Set window enables you to define dosage limits as seen in the screen below.

SapphirePlus 14.x
Chapter 12: SapphirePlus Medication Entries

SapphirePlus 13.x

Note: For a list of Hospira MedNet compatible devices approved by country, refer to the Hospira MedNet Device Compatibility Matrix available through your Hospira Support Center.
# Rule Set Fields

The following table lists the fields, a brief description, and allowed value range for the infuser.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Allowable Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generic Name</td>
<td>The medication name from the Medication List. It is selected from the drop-down list and displays the External ID (the hospital’s identifier for a medication). Strength/Volume and Dosage Form display only if part of your Medication List.</td>
<td>Not editable in Hospira MedNet Meds.</td>
</tr>
</tbody>
</table>
| Displayed Name      | The name that will be displayed on the infuser.                                                                                                                                                               | • Cannot be blank  
|                     | • Each medication entry must have a generic name and a displayed name; you cannot save a medication entry without a name in these fields. The number of characters in the displayed name is determined by how it is displayed on the infuser’s screen. | • The maximum number of characters allowed in a displayed name is 15 (SapphirePlus 13.x) or 40 (SapphirePlus 14.x) when using both Displayed Name fields.  
|                     | • Displayed Name cannot contain comma (,) lesser than (<), greater than (>), or double-quote (“) characters. All alphabetic and numeric characters are acceptable as are . % / # * - _ & ( ) + SPACE |                                                                                                           |
| Therapeutic Class   | The therapeutic class assigned to the medication.                                                                                                                                                           | Not editable in Hospira MedNet Meds.                                                                         |
| Class ID            | The ID of the therapeutic class assigned to the medication.                                                                                                                                                 | Not editable in Hospira MedNet Meds.                                                                         |
| No Concentration    | Allows you to create an entry for medications when concentration is not needed.                                                                                                                             | Checked or Unchecked                                                                                      |
| Diluent Only        | Allows you to create a medication entry for plain IV solutions or those IV fluids where concentration is not important in defining the rule set, i.e., when dosing units are mL/kg/hr or mL/hr. | Checked or Unchecked                                                                                      |
| Medication Amount   | Allows you to enter the medication amount in the units selected.                                                                                                                                              | mcg, mg, grams, mmol, Million Units, milliUnits, units, mEq  
|                     | • 0.01-99.99 in increments of 0.01  
|                     | • 100-9999999 in increments of 1                                                                                                                                                                            |                                                                                                           |
| Medication Unit     | Allows you to select the unit of measure for the medication amount.                                                                                                                                           | mcg, mg, grams, mmol, Million Units, milliUnits, units, mEq. For SapphirePlus 14.x only: nanog           |
| Diluent Amount      | Allows you to set the total volume of the medication container or syringe.                                                                                                                                   | For mL:  
|                     | • 0.1-99.9 mL in increments of 0.1  
<p>|                     | • 100-9999 mL in increments of 1                                                                                                                                                                |</p>

</table>
| Therapies                    | Therapies allowed for the drug entry. Choosing one of these determines where the drug is listed on the infuser. | • Basic (Continuous)  
• Piggyback (Secondary)  
• Multistep                                                                                                                                       |
| Enable Bolus                 | Indicates this medication will be available for a bolus therapy on the infuser and may be administered as a bolus that is independent of the limits governing a basic infusion. | For SapphirePlus 13.x Checked or Unchecked  
For SapphirePlus 14.x Disabled, Simple, or Advanced                                                                                                 |
| Bolus Amount Limits¹         | Allows you to define the total amount of medication that can be administered in a bolus. | For mL:  
• 0.1-99.9 in increments of 0.1  
• 100-9999 in increments of 1  
For nanog, mcg, mg, gram, milliUnits- and units-based, Million Units, mEq, mmol:  
• 0.001-99.999 in increments of 0.001  
• 100-99999999 in increments of 0.1 |
| Maximum Bolus Amount and Units¹ | Enabled when the selected Bolus Amount Limits Unit is weight-based. If the Bolus Amount Limits Unit is not mL/kg, the allowable values are the same as those in the selected Bolus Amount Limits Unit family (mmol, mEq, Units, or grams), and exclude weight-based.  
If the Bolus Amount Limits Unit is mL/kg, the Maximum Bolus Amount Units are mL. | See Bolus Amount Limits.                                                                                                                             |
| Bolus Time¹                  | Allows you to define the time period over which a bolus can be administered, in hh:mm format. | Entered Time:  
• 00:01-99:59 in increments of 00:01                                                                                                           |

¹ Visible only when Bolus is enabled.
### Bolus Dose Rate Limits

Allows you to define the rate at which a bolus can be administered.

- **For mL family (Basic, Multistep and Bolus):**
  - 0.1-99.9 in increments of 0.1
  - 100-999 in increments of 1

- **For mL (Piggyback only):**
  - 0.1 - 99.9 in increments of 0.1
  - 100 - 500 in increments of 1

- **For the following families: grams, units, Million Units, mEQ-based, and mmol:**
  - 0.001-99.999 in increments of 0.001
  - 100-99999999 in increments of 1

### Delivery at End of Infusion

None/stop, Continue Rate or KVO (Default KVO Rate: 0.1-20 mL/hr)

1 Visible only when Bolus is enabled.

Refer to your infuser's System Operating Manual for complete details and allowable range.
Step-by-step Procedures

The following section provides step-by-step procedures that enable you to create and manage medication entries. In this section you will learn how to do the following:

- Add a medication entry in a CCA
- Edit a medication entry in a CCA
- Create a medication entry in the Master Drug Formulary
- Edit a medication entry in the Master Drug Formulary
- View a medication entry in the Master Drug Formulary
- Delete a medication entry from the Master Drug Formulary
- Copy a medication entry from the Master Drug Formulary to a Target CCA

To add a medication entry in a CCA:

1. Select the desired CCA from the drop-down Target List.
2. Click Add, from the Target List.
3. Select the **Generic Name** for the medication entry from the medication list.

![Medication Selection Screen](image.png)

4. Click **Select Medication**.

**Note:** Selecting a **Generic Name** from the medication list automatically populates the **Displayed Name**, **External ID**, **Therapeutic Class**, and the **Class ID** fields.
5. The **Displayed Name** can be edited once populated. You can either accept or edit the Displayed Name before continuing. For **SapphirePlus 14.x**, the maximum number of characters in the **Displayed Name** is 40 when using the two available fields.

For **SapphirePlus 13.x**, the maximum number of characters in the **Displayed Name** is 15. If the Displayed Name exceeds the character limit, the name will be automatically truncated.

6. Configure the desired concentration values by either:
   a. Checking **No Concentration**, or
   b. Checking **Diluent Only**, or
   c. Entering/selecting values for **Medication Amount**, **Medication Unit**, and **Diluent Amount**.

7. Set the **Dose Rate Limits** by selecting the Dosing Unit from the drop-down list; then enter the desired values for Lower Hard Limit, Lower Soft Limit, Upper Hard Limit, and Upper Soft Limit.

   **Note:** Dose Rate Limits are optional but Dosing Unit must be selected.

8. Select the **Bolus** option(s) if you want to set bolus dose limits for this medication (Optional). If you do not choose to set Enable Bolus, proceed to the next step.
To set a SapphirePlus bolus:

Select from **Disabled**, **Simple**, or **Advanced** for the SapphirePlus 14.x, or check **Enable Bolus** for SapphirePlus 13.x.

- **Disabled** (SapphirePlus 14.x only)
- **Simple** (SapphirePlus 14.x only). When this option is selected, the **Bolus Amount Limits** Unit field is available. Select a unit from the drop-down list and enter desired values for Lower Hard Limit, Lower Soft Limit, Upper Hard Limit, and Upper Soft Limit.

**Note:** For a SapphirePlus 13.x bolus, there is no Simple setting. Bolus Amount Limits, Bolus Time Limits, and Bolus Dose Rate Limits are available to be set when **Enable Bolus** is selected.

- **Advanced**. When the Advanced option is selected, the following fields are available:
  a. **Bolus Amount Limits Unit**. Select from the drop-down list and enter the desired values for Lower Hard Limit, Lower Soft Limit, Upper Hard Limit, and Upper Soft Limit. This is a required field.
  c. Select the **Bolus Dose Rate Limits** from the Dosing Unit drop-down list. Enter the desired values for Lower Hard Limit, Lower Soft Limit, Upper Hard Limit, and Upper Soft Limit (optional).
9. For **Therapies**, check or uncheck Basic (Continuous), Piggyback (Secondary), and Multistep, as needed. At least one of the therapies must be checked to enable the medication to be selected from the Program screen on the infuser.

10. **Delivery at End of Infusion** (for SapphirePlus 14.x only) allows you to select from None/Stop, Continue Rate or KVO (Default KVO rate is 0.1-20 mL/hr).

11. Click **Save & Add Another** or **Save & Close** to add the medication entry to the CCA.
To edit a medication entry in a CCA:

1. Select the CCA containing the medication entry you want to edit from the **Target List** drop-down.
2. From the **Target List**, select the medication entry you want to edit.
3. Click **Edit**.

   **Helpful Hint:** You can also double-click a medication entry to display the **Rule Set** dialog box.
4. Make changes as desired.
5. Click **Save & Close** to save your changes.

**Note:** Medication entries in the Master Drug Formulary will be updated with the same change.

If you edit a medication entry in one CCA and then edit another CCA with different rule sets, there will be two medication entries in the Master Drug Formulary that will show the same medication but each will have its own rule set.
To view a medication entry in a CCA:

1. Select the CCA containing the medication entry you want to view from the **Target List** drop-down list.

2. Select a medication.
3. Click **View**.
4. Click **Close** to exit the screen.
To remove a medication entry from a CCA:

1. Select the CCA containing the medication entry you want to remove from the Target List drop-down.
2. Select a medication.
3. Click Remove from CCA.
4. From the Confirm Remove from CCA pop-up, click Remove.

**Note:** The medication entry is not removed from the Master Drug Formulary.
Working with the Master Drug Formulary

Note: Refer to the Rule Set Fields on page 213 in this chapter for information on allowable ranges.

To add a medication entry in the Master Drug Formulary:

1. Select Master Drug Formulary as the Source List.
2. From the Source List, click Add.
3. Select the Generic Name for the medication list.
4. Click Select Medication.

Note: Selecting a Generic Name from the medication list automatically populates the Displayed Name, External ID, the Therapeutic Class, and the Class ID fields.

If the desired generic name is not in the Generic Name list, you may add a medication to the Medication List. Alternatively, you can add the generic name by importing a new Medication List via the Medication Import function of the Hospira MedNet software.
Note: The **Displayed Name** can be edited once populated. The maximum number of characters in the **Displayed Name** is 40 for SapphirePlus 14.x when using the two available fields.

For SapphirePlus 13 the maximum number of characters is 15. If the Displayed Name exceeds the character limit, the name will be automatically truncated.

You can either accept or edit the Displayed Name before continuing.

5. Configure the desired concentration values by either:
   a. Checking **No Concentration**, or
   b. Checking **Diluent Only**, or
   c. Entering/selecting values for **Medication Amount**, **Medication Unit**, and **Diluent Amount**.

6. Set the **Dose Rate Limits** by selecting the Dosing Unit from the drop-down list; then enter the desired values for Lower Hard Limit, Lower Soft Limit, Upper Hard Limit, and Upper Soft Limit.

   **Note:** Dose Rate Limits are optional but Dosing Unit must be selected.

7. Select the **Bolus** option(s) if you want to set bolus dose limits for this medication (Optional). If you do not choose to set Enable Bolus, proceed to the next step.
To set a SapphirePlus bolus:

Select from **Disabled**, **Simple**, or **Advanced** for the SapphirePlus 14.x, or check **Enable Bolus** for SapphirePlus 13.x.

- **Disabled**
- **Simple.** When this option is selected, the **Bolus Amount Limits** Unit field is available. Select a unit from the drop-down list and enter desired values for Lower Hard Limit, Lower Soft Limit, Upper Hard Limit, and Upper Soft Limit.

**Note:** For a **SapphirePlus 13.x bolus**, there is no Simple setting. Bolus Amount Limits, Bolus Time Limits, and Bolus Dose Rate Limits are available to be set by checking **Enable Bolus**.

- **Advanced.** When the Advanced option is selected, the following fields are available:
  
a. **Bolus Amount Limits Unit.** Select from the drop-down list and enter the desired values for Lower Hard Limit, Lower Soft Limit, Upper Hard Limit, and Upper Soft Limit. This is a required field.

b. **Bolus Time Limits:** Lower Hard Limit, Lower Soft Limit, Upper Hard Limit, and Upper Soft Limit.

c. Select the **Bolus Dose Rate Limits** from the Dosing Unit drop-down list. Enter the desired values for Lower Hard Limit, Lower Soft Limit, Upper Hard Limit, and Upper Soft Limit (optional).
8. For **Therapies**, check or uncheck Basic (Continuous), Piggyback (Secondary), and Multistep, as desired.

9. **Delivery at End of Infusion** (SapphirePlus 14.x only). Select from None/Stop, Continue Rate or KVO (Default KVO rate is 0.1-20 mL/hr)

10. Click **Save & Add Another** or **Save & Close** to add the medication entry to the CCA.

**Note:** When a medication entry is added to the Master Drug Formulary, it is not assigned to a CCA.
To edit a medication entry in the Master Drug Formulary:

1. Select Master Drug Formulary from the Source List.
2. From the Source List, select the medication entry you want to edit.
3. Click Edit.

![Source List: Master Drug Formulary](image)

Helpful Hint: You can also double-click a medication entry to display the Rule Set dialog box.

4. Make any desired changes.

![Source List: Edit Rule Set](image)

5. Click Save & Close to save your changes.

Note: When a medication entry is edited, the changes are reflected in the Master Drug Formulary and a pop-up displays the CCAs that are affected.

If the medication entry that is edited is assigned to only one CCA, the medication entry will also be updated in the Master Drug Formulary. If the medication entry that is edited is assigned to more than one CCA, a new medication entry will be created in the Master Drug Formulary.
To view a medication entry in the Master Drug Formulary:

1. Select **Master Drug Formulary** from the Source List.
2. From the Source List, select the medication entry you want to view.
3. Click **View**.
4. Click **Close**.

**Note:** For a list of Hospira MedNet compatible devices approved by country, refer to the Hospira MedNet Device Compatibility Matrix available through your Hospira Support Center.
To delete a medication entry from the Master Drug Formulary:

1. Select **Master Drug Formulary** from the Source List.
2. From the Source List, select the medication entry you want to delete.
3. Click **Delete** from Master Formulary.
4. Click **Delete**.
A **Delete Medication** pop-up displays only if a CCA is affected. If not, the entry is deleted and there is no confirmation.

5. Click **OK**.
To copy to a Target CCA:

1. Select a medication entry from the Master Drug Formulary.

**Note:** A Target List CCA must be selected before you can copy a medication entry to a Target CCA from the Master Drug Formulary.

2. Click **Copy to Target CCA**.

3. Click **Copy** on the **Confirm Copy to CCA** pop-up.
Chapter 13: Master Infuser Setup

Plum 360 Master Infuser Settings

The Plum 360 Master Infuser Settings view allows you to select the following infuser settings:

- Continue Rate
- Callback Notification
- Deliver Together
- Force Pump to Accept Drug Library During Power Down
- Auto-program Rejection Reason Timeout (seconds)
- Maximum Standby Time (hours)
- Default Clinical Use

To display the Master Infuser Settings view, open a Worksheet and click the Master Infuser Setup tab. (For instructions on opening a Worksheet, see Chapter 5: The Library Directory on page 29).

Continue Rate

The Continue Rate setting allows you to select the default rate the infuser switches to after a therapy has completed. The Continue Rate options are KVO and Rate. KVO (Keep Vein Open) is a very low rate (1 mL/hr) that reduces the potential for clotting at the infusion site. Rate is the same delivery rate as the completed therapy. The Continue Rate setting can be changed when programming the infuser:

- Select KVO to make the default continue rate KVO.
- Select Rate to make the default continue rate the same as the completed therapy’s rate.
Callback Notification

The **Callback Notification** setting, when enabled, causes the infuser to emit an audible nurse callback alarm and display a notification between steps of a multi-step infusion, a piggyback infusion, or after a loading dose. The default Callback Notification setting is **No** (disabled). This setting can be changed when manually programming the infuser. For more information on nurse callback alarms, refer to the infuser’s system operating manual.

Deliver Together

The **Deliver Together** setting allows you to choose the default two-line delivery method. This functionality defines the default relationship between Line A and Line B on the infuser. The Deliver Together options are **Piggyback** and **Concurrent**. When Piggyback is selected, Line A delivery stops while Line B infuses. Line A delivery resumes when Line B delivery is complete. When Concurrent is selected, both lines infuse at the same time. The Deliver Together setting can be changed when programming the infuser.

- Select **Piggyback** to make the default deliver together setting piggyback
- Select **Concurrent** to make the default deliver together setting concurrent

Force Pump to Accept Drug Library During Power Down

This setting determines if the infuser will automatically install a new Medication Library upon infuser turn off. If setting is **Yes**, the infuser will install library without prompting user during power down. The default setting is **No**.

Auto-program Rejection Reason Timeout (seconds)

When an auto-program is rejected by Hospira MedNet, a rejection reason appears on the infuser to notify the nurse that the auto-program has been rejected prior to sending to the infuser. The timeout setting allows you to set the length of time the message will remain on the infuser’s screen. The range is 10-30 seconds and the default is 15 seconds.

Maximum Standby Time (hours)

The **Maximum Standby** setting allows you to select the period of time the infuser can wait before beginning a therapy. The Standby setting **cannot** be overridden when programming the infuser.

**Note:** This setting affects both delayed start and standby. If enabled, both will be available at the infuser. If disabled, neither will be available at the infuser.

The range is 24 to 72 hours in one-hour increments. The default is 72 hours.

Default Clinical Use

The **Default Clinical Use** setting allows you to change the “NOT SPECIFIED” value entered in a CCA to the Default Clinical Use you enter.

**Note:** The value entered as Default will be attributed to ALL entries marked “NOT SPECIFIED” in all CCAs and in the Master Drug Formulary.
To configure the master infuser settings:

1. Click the Master Infuser Setup tab.
2. Select the desired option for each setting.
3. When finished making selections, click Save.

Note: To save changes to the master infuser settings, you must click Save before navigating away from the Master Infuser Settings view.

The selections made in the Master Infuser Settings view apply to all CCAs in the library.
Plum A+ Master Infuser Settings

The Plum A+ Master Infuser Settings view allows you to select the following infuser settings:

- Continue Rate
- Callback Notification
- Deliver Together
- Enable Delay/Standby

To display the Master Infuser Settings view, open a Worksheet and click the Master Infuser Setup tab. (For instructions on opening a Worksheet, see Chapter 5: The Library Directory on page 29).

**Continue Rate**

The Continue Rate setting allows you to select the default rate the infuser switches to after a therapy has completed. The Continue Rate options are KVO and Rate. KVO (Keep Vein Open) is a very low rate (1 mL/hr) that reduces the potential for clotting at the infusion site. Rate is the same delivery rate as the completed therapy. The Continue Rate setting can be changed when programming the infuser:

- Select **KVO** to make the default continue rate KVO.
- Select **Rate** to make the default continue rate the same as the completed therapy’s rate.
**Callback Notification**

The *Callback Notification* setting, when enabled, causes the infuser to emit an audible nurse callback alarm and display a notification between steps of a multi-step infusion, a piggyback infusion, or after a loading dose. The default Callback Notification setting is *No* (disabled). This setting can be changed when manually programming the infuser. For more information on nurse callback alarms, refer to the Hospira Plum A+/A+ 3 System Operating Manual.

**Deliver Together**

The *Deliver Together* setting allows you to choose the default two-line delivery method. This functionality defines the default relationship between Line A and Line B on the infuser. The Deliver Together options are *Piggyback* and *Concurrent*. When Piggyback is selected, Line A delivery stops while Line B infuses. Line A delivery resumes when Line B delivery is complete. When Concurrent is selected, both lines infuse at the same time. The Deliver Together setting can be changed when programming the infuser.

- Select *Piggyback* to make the default deliver together setting piggyback
- Select *Concurrent* to make the default deliver together setting concurrent

**Enable Delay/Standby**

The *Enable Delay/Standby* setting allows you to select the standby setting, *Yes* (enabled) or *No* (disabled). When enabled, the infuser can be programmed to wait for a period of time before beginning a therapy. When disabled, the option to program a waiting period before a therapy begins is not available. The Standby setting cannot be overridden when programming the infuser.

---

**Note:** This setting affects both delayed start and standby. If enabled, both will be available at the infuser. If disabled, neither will be available at the infuser.

- Select *Yes* to enable Delay/Standby
- Select *No* to disable Delay/Standby

---

---
To configure the master infuser settings:

1. Click the **Master Infuser Setup** tab.
2. Select the desired option for each setting.
3. When finished making selections, click **Save**.

Note: To save changes to the master infuser settings, you must click **Save** before navigating away from the **Master Infuser Settings** view.

The selections made in the Master Infuser Settings view apply to all CCAs in the library.
LifeCare PCA Master Infuser Settings

The LifeCare PCA Master Infuser Settings view allows you to select the following infuser settings:

- Nurse Call Relay Contacts
- Auto-programming
- Purge Capability
- PCA Tone
- History Format
- Clock Format
- Alarm Sounds

To display the Master Infuser Settings view, open a Worksheet and click the Master Infuser Setup tab. (For instructions on opening a Worksheet, see Chapter 5: The Library Directory on page 29).

Nurse Call Relay Contacts

The Nurse Call Relay setting allows you to set up the nurse call relay system. The pump needs to be connected to the nurse call relay system in the hospital using the jack on the rear of the pump.

The proper configuration (Normally Open or Normally Closed) will depend on how the health care facility has set up their particular nurse call relay system. The default setting is Normally Open.
History Format
The History Format setting allows you to select the format of the history (infusions, PCA doses, and event log) when viewed on the pump screen.

- **1 & 24 hours** – shows infusion summary for the last one and 24 hours
- **Hour by hour** – shows infusion summary by hour

The default is 1 & 24 hours.

Purge Capability
The Purge Capability setting allows you to enable the screen prompts on the pump to ask if the clinician would like to purge the set before programming the pump. The default is Enabled.

PCA Tone
The PCA Tone setting allows you to determine what tones are emitted from the pump when the pendant is pressed by the patient. A successful request means a PCA dose was delivered to the patient, while a Reject means a PCA dose was not delivered (because it was during the lockout period). The default is Different Accept/Reject tones.

- **Key tone on successful request only** – An audible beep is heard when a PCA dose is successfully administered.
- **Different Accept/Reject tones** – A different audible beep is heard when a PCA dose is accepted or rejected. This is the default setting.
- **Same key tone on all PCA requests** – The same audible beep is heard regardless of whether a PCA dose was successful or rejected.

Clock Format
The Clock Format setting allows you to set the display of the clock to either a 12-hour or a 24-hour format. The default is a 24-hour Clock format.

Alarm Sounds
The Alarm Sounds setting allows you to select different rhythms or cadences for the alarms on the pump. This allows you to differentiate the pump alarm sound from other devices. There are five sounds available. The default is Alarm 1.

**Note:** To save changes to the master infuser settings, you must click **Save** before navigating away from the **Master Infuser Settings** view.

The selections made in the Master Infuser Settings view apply to all CCAs in the library.
SapphirePlus 13.x Master Infuser Settings

The SapphirePlus Master Infuser Setup view allows you to select the **Device-Level Program Lock/Unlock**.

This feature allows you to set a passcode that the clinician can use to lock the pumps so program and pump parameters cannot be modified. You cannot start or stop a delivery when the device is locked.

**Note:** To save changes to the master infuser settings, you must click **Save** before navigating away. The selection you make applies to all SapphirePlus CCAs in the library.
SapphirePlus 14.x Master Infuser Settings

The SapphirePlus Master Infuser Setup allows the setting of passwords authorizing different levels of programming options. Each level allows actions on that level and lower level.

The device authorization levels are:

**High Level** and **Preprogram** Levels: allow full access for all tasks and configuration settings. High level authorized personnel can reset the lock level of the infuser.

**Medium Level**: allows basic programming options, such as starting infusions, repeating the last infusion and priming the infuser. No new infusion can be started with this level password.

**Low Level**: has no programming options and no ability to change any setting. However, at this level, the infuser can be stopped and infusion allowed to continue.

**Note**: All levels can administer a patient bolus.

Please refer to the SapphirePlus 14 literature for additional details of allowable functions per level.

**Infuser Settings**

**Enable New Patient** is the default setting.

**Enable US Format** sets the format to a 12-hour clock (AM/PM time setting) and US date format of month/day/year. If unchecked, the format is a 24-hour clock and a date format of day/month/year.
Appendix A: Hospira MedNet Integrator

Overview

Hospira MedNet Integrator provides interfaces to a hospital’s enterprise level applications and serves as the conduit for the exchange of data between infusers, the Hospira MedNet server, and a variety of hospital information systems.

When interfaced to a BCMA system, Hospira MedNet Integrator supports electronic documentation of IV administration events into the patient record. This integration also allows the BCMA system to incorporate the IV infusion rate into the five Rights verification process.

The workflow for the clinician is as follows:

- Scan the patient identification, the medication container, and the pump using the BCMA application and its bar code scanner
- Program the infuser based on the physician’s order
- Confirm the programming and start the infusion

**Note:** Depending on the BCMA system, scanning of the patient, medication, and pump may also occur after the infusion has been started.

Once the infusion has started, Hospira MedNet sends the program values (medication/concentration, dose, rate, volume to be infused, and duration) back to the BCMA system for review by the clinician, verification, and electronic charting.

**Note:** The specific functionality available to you will depend on your institution’s Hospira MedNet software license.

Setting up Hospira MedNet Integrator for BCMA integration

Define a bar code strategy for identifying each channel of the infusers that will be used; affix the bar code label to each channel

**WARNING:** To ensure that information is sent to the Bar Code Medication Administration (BCMA) system from the correct infuser, Hospira strongly recommends that before go-live with Hospira MedNet Integrator you verify the bar code label affixed to each infuser corresponds to the correct channel.

**Important:** Please compare the infuser data on the infuser with the data received from the BCMA. In the event of a discrepancy, please chart the infuser data manually.

</tbody>
</table>
| Rule Set                                  | Constraints that are assigned to medication entries. The type of rule for the medication in the drug library  
• For LifeCare PCA, Rule Sets include PCA, Continuous, Loading, or Dose Limit  
Rule sets can include both soft and hard limits. The Plum A+ has a single rule set    |
| Service Line                              | A designation used in reports to aggregate data across multiple CCAs or facilities. Each CCA is mapped to a Service Line. For example, a service line called Med/Surg may be used to examine data from the CCAs Four West, Five North, and Five East in a single hospital |
| Soft Limit                                | Upper and/or lower dose limits for the selected medication and selected CCA that can be overridden. Soft limits for a particular medication may vary across CCAs                                                   |
| Soft Limit Alert                          | An alert presented to the user when a soft limit is exceeded. The user may choose to edit or override the value entered in response to the alert                                                               |
| Standby                                   | Programming option that allows the infusion to be started at a later time. Similar to delayed start                                                                                                           |
| Standard Syringe (LifeCare PCA)           | Prefilled, bar-coded vial. Standard syringes are also known as prefilled medication vials                                                                                                                     |
| Variance                                  | Variance is a calculated value intended to represent how far away the user's initial programmed value was compared to the defined limit. Variance is defined as \[(\text{Initial Dose} - \text{Limit Violated}) / \text{Limit Violated}\], expressed as a percentage, shown as a negative number for Lower Limit violations and a positive number for Upper Limit violations. |
| VTBI                                      | Acronym for Volume To Be Infused                                                                                                                                                                            |
| Worksheet                                 | Draft drug library that has not yet been finalized                                                                                                                                                           |
